

Stroke Lesion Segmentation in Perfusion Images using Fully Convolutional Neural Networks

S. Mazdak Abulnaga^{1,2,*}, Jonathan Rubin¹

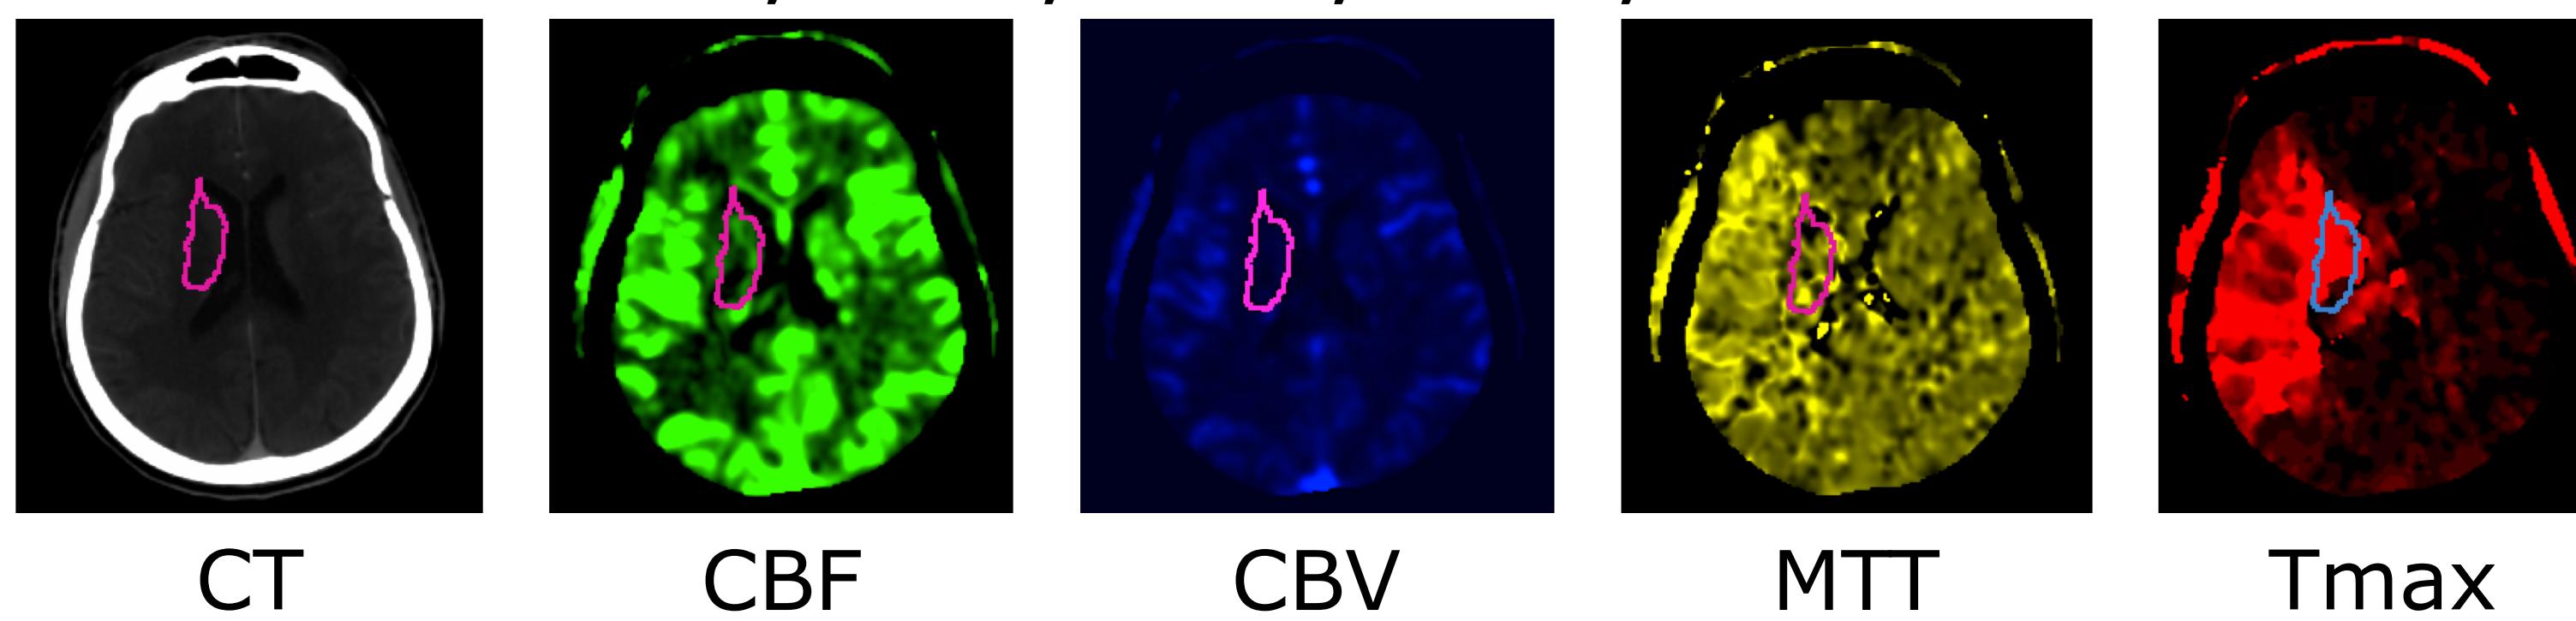

¹Philips Research North America, ²Computer Science and Artificial Intelligence Laboratory, MIT Cambridge, MA, USA; *abulnaga@mit.edu

Goal: Automatically segment ischemic stroke lesions in CT perfusion images as part of the ISLES 2018 challenge.

Motivation:

- CT imaging is more accessible than MRI
- Improve time-sensitive treatment planning

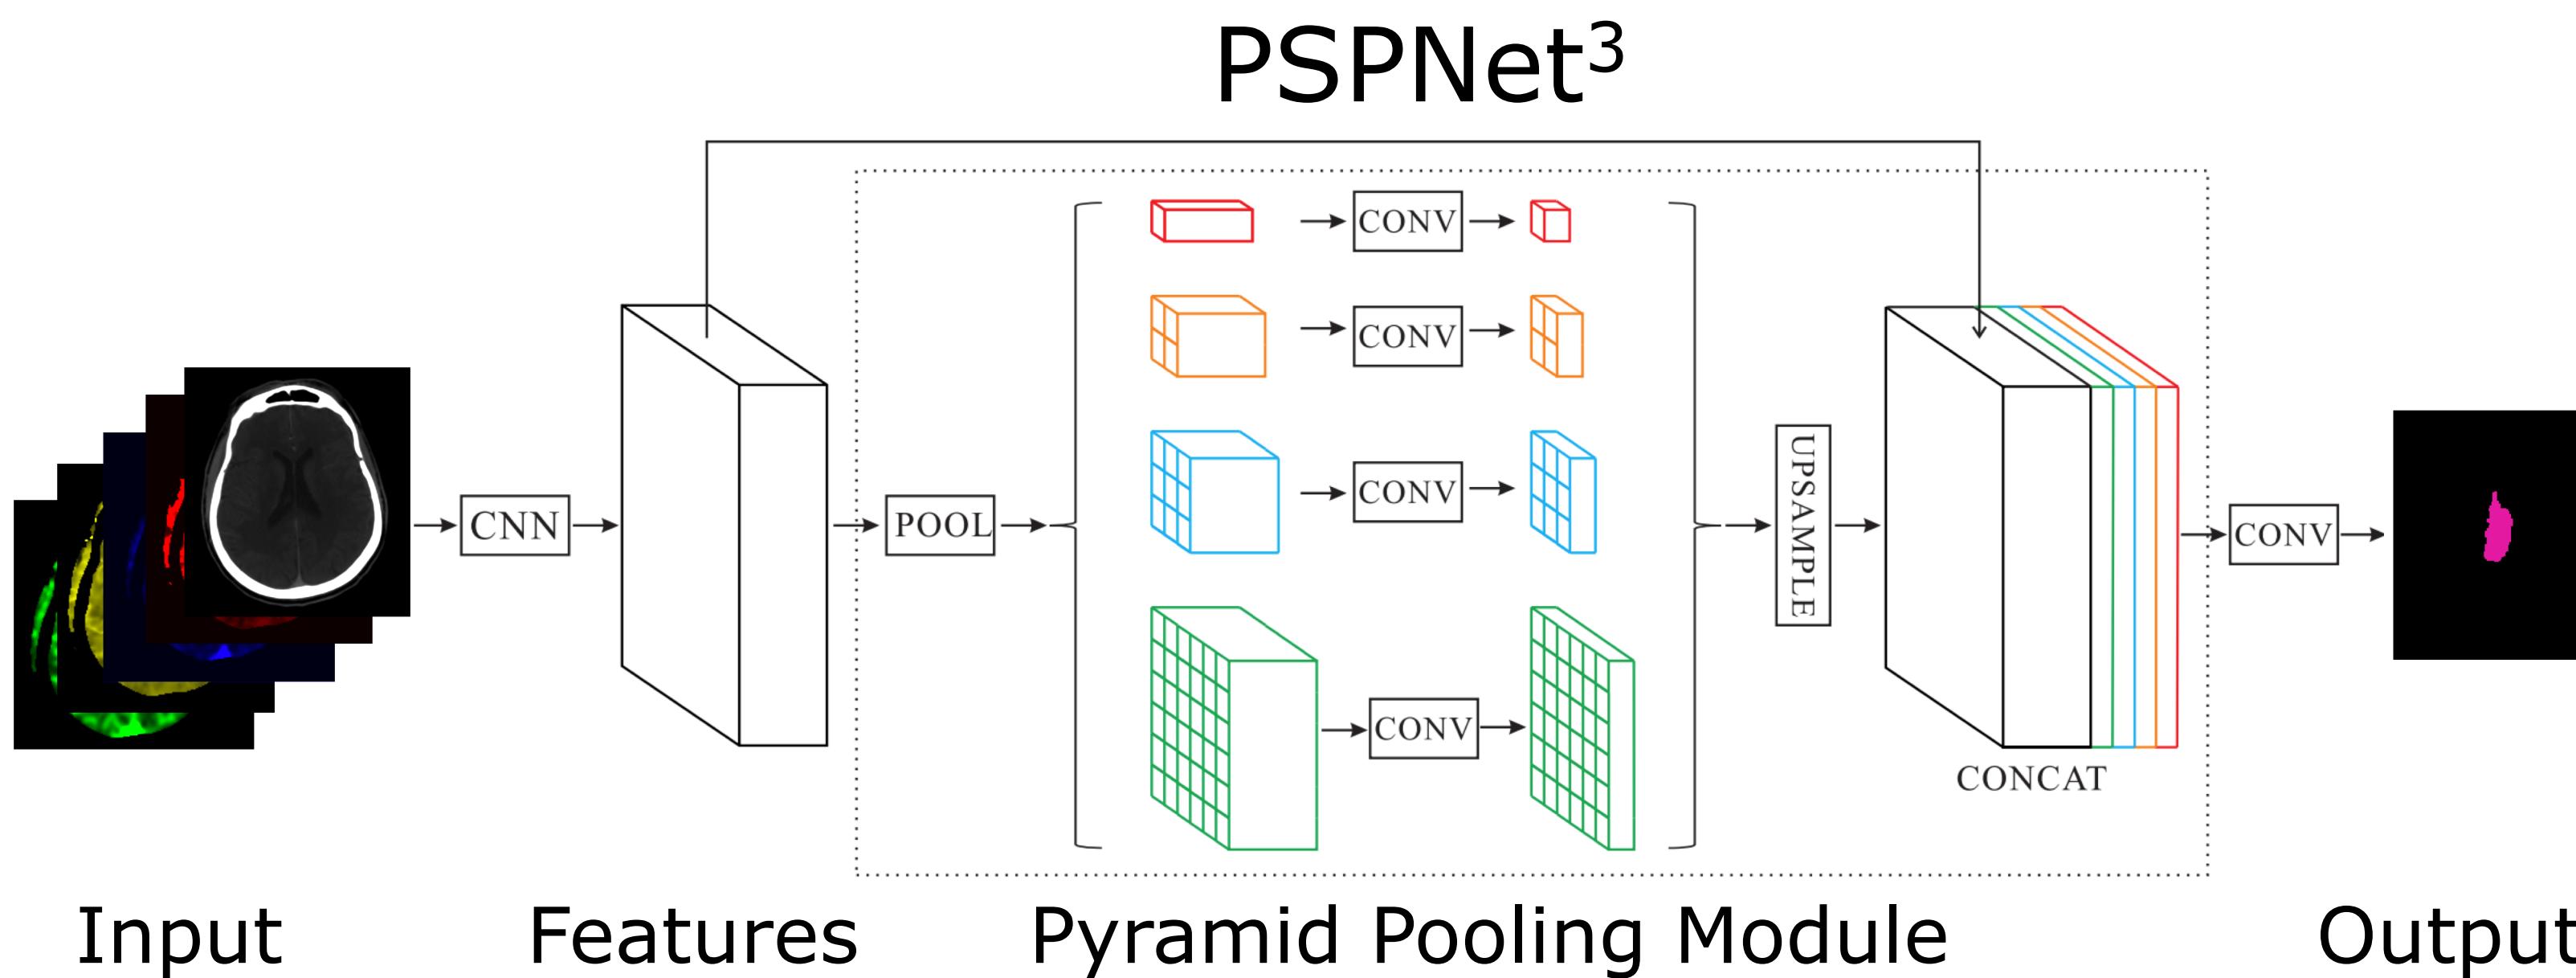

Data: stack CT, CBF, CBV, MTT, Tmax

Augmentation: flip, rotate, translate, elastic deformation

Models:

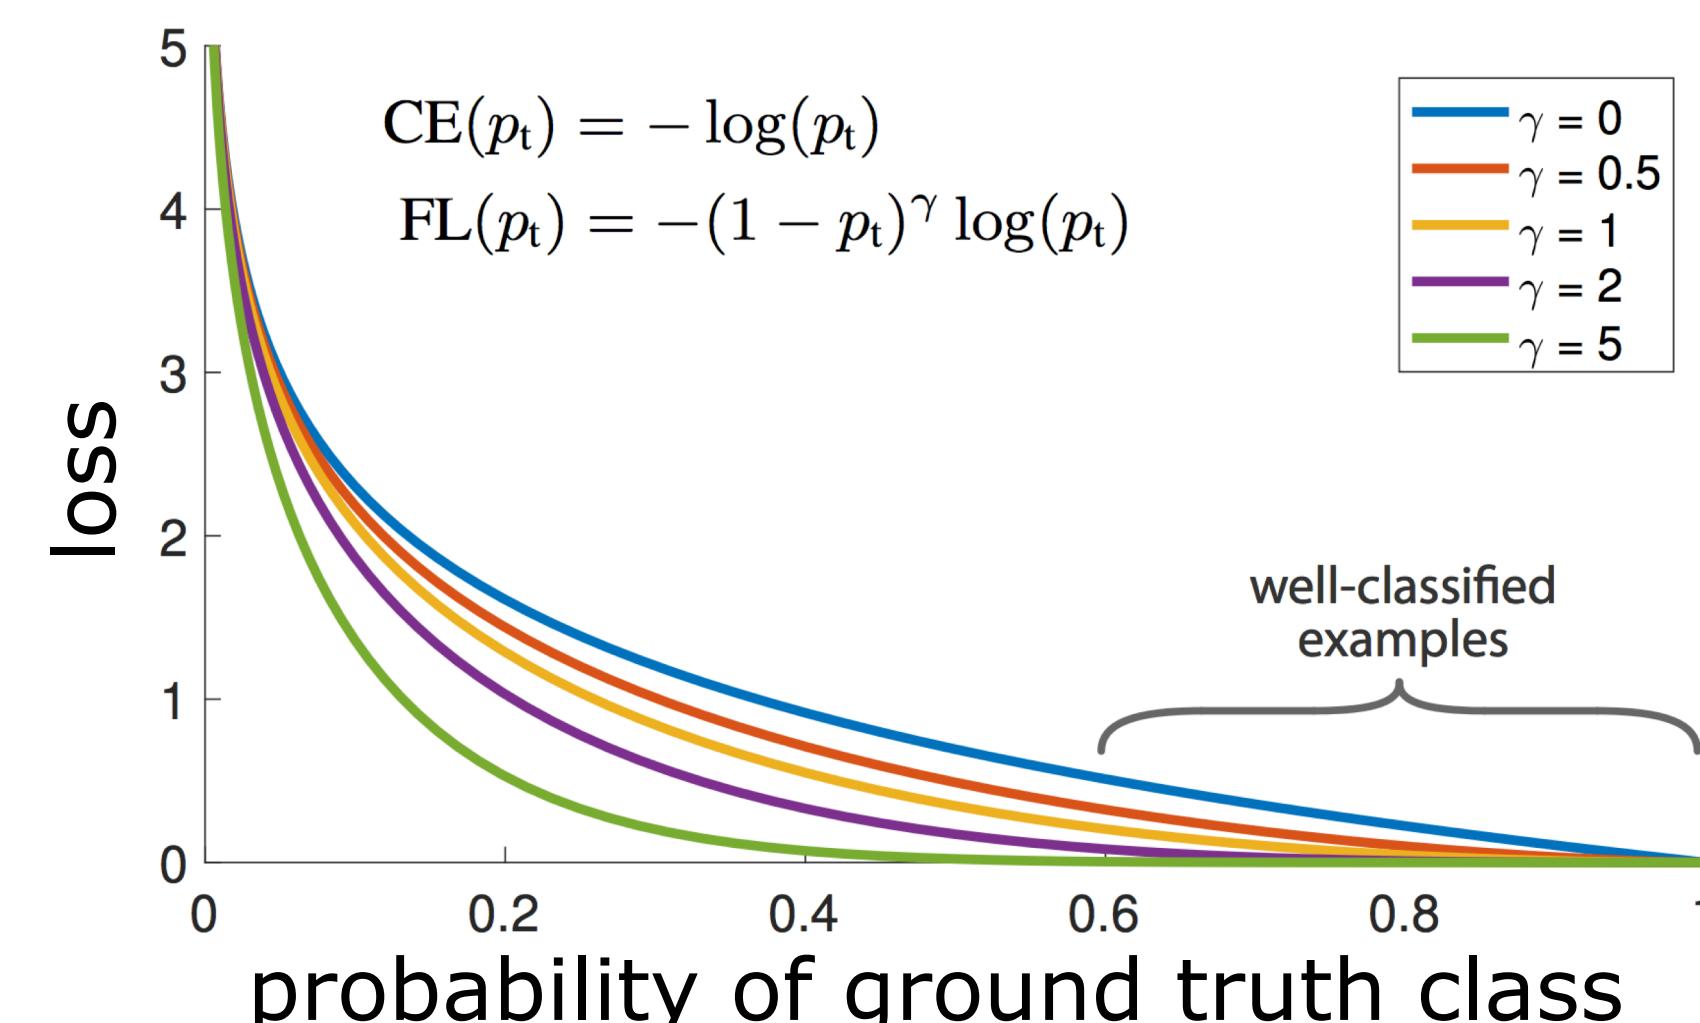

- 2D: U-Net¹, DenseNet², PSPNet³
- 3D: U-Net¹, V-Net⁴

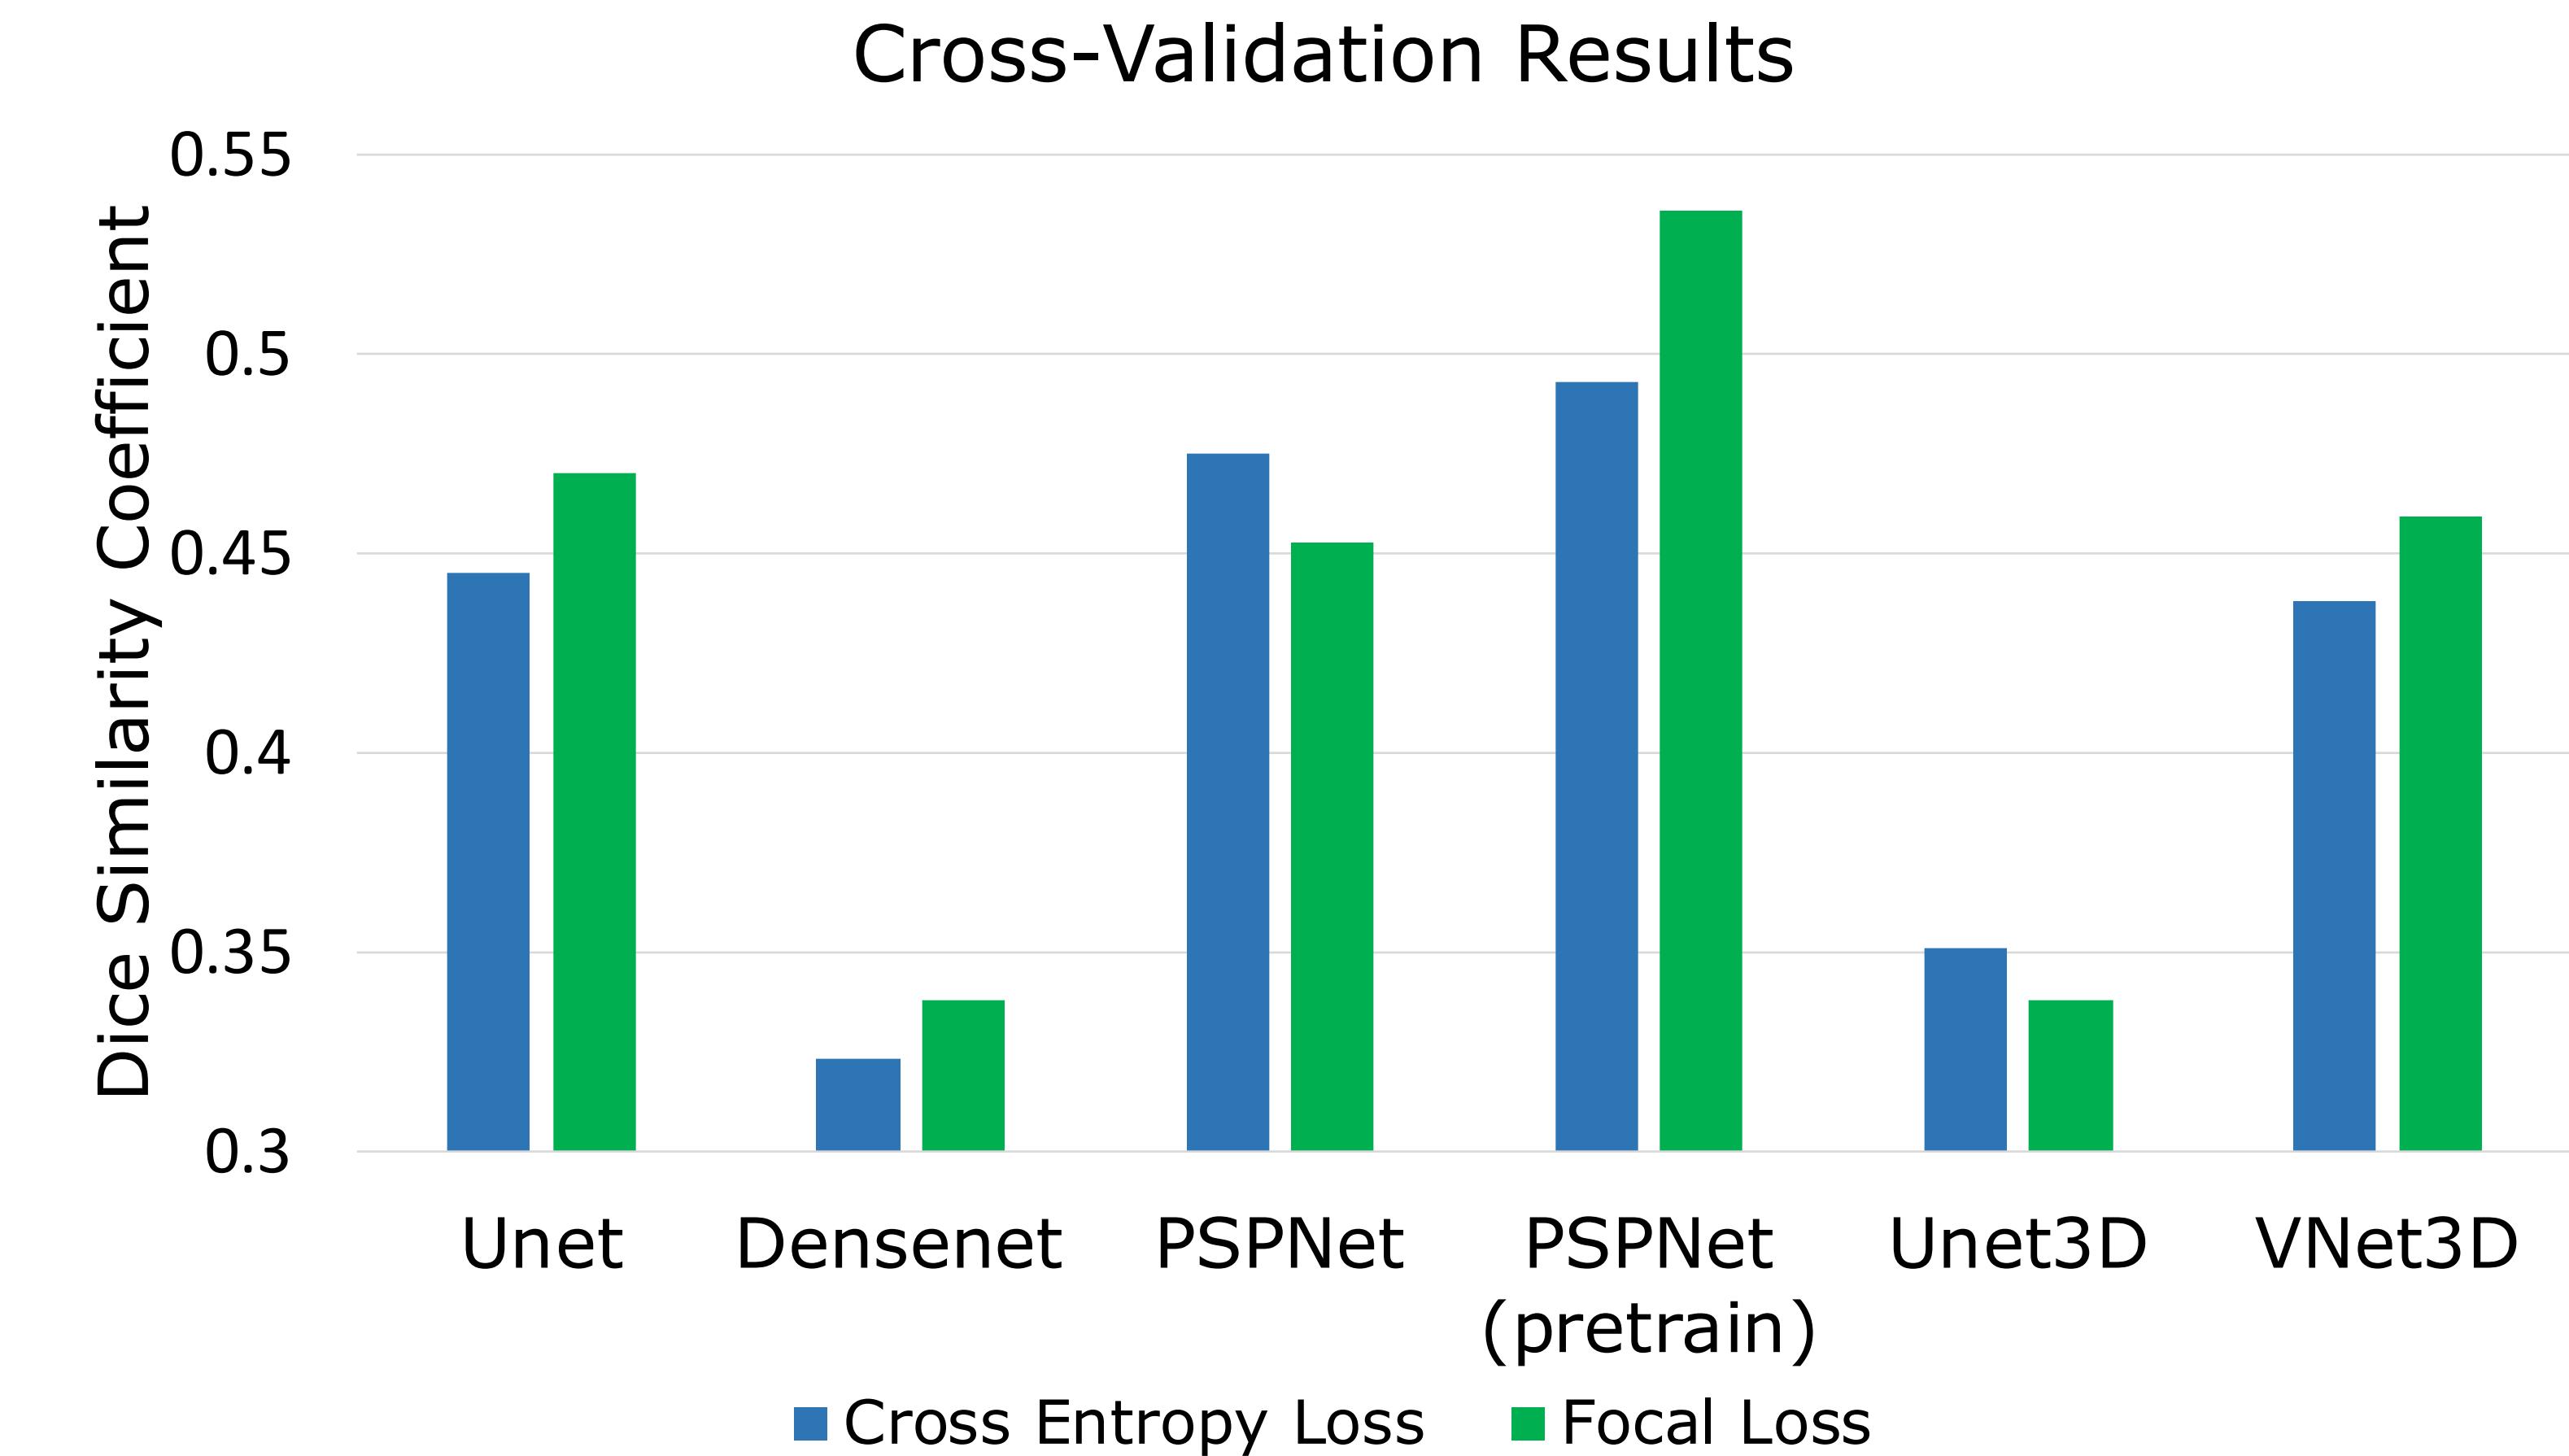

Loss functions:

- Cross-Entropy
- Focal Loss⁵

$$FL(p_n) = \begin{cases} (1 - p_n)^\gamma \log(p_n) & y_n = 1 \\ p_n^\gamma \log(1 - p_n) & y_n = 0 \end{cases}$$

Evaluation: 5-fold cross-validation, Dice Similarity Coefficient

Focal loss can discriminate finer details

Submission: 1) Ensemble PSPNet, U-Net (2D)
2) V-Net
