How do we

Start

Preparing?

# Workload

# Workload

# Workload

Problem!

# Changing Workload!

Time

# Several Workloads!

# No Workload!

Adapt?

Adapt?

Adapt?

Workload-based  
Approach!

Robust  
Approach!

# Prepare Exhaustively!

- Consider all possible workloads
- Could be expensive
- But, bad performance not a problem anymore

# Prepare Selectively!

- Consider some of the workloads
- Uniformly pick from the search space
- Lower probability of bad performance

# Prepare Partially!

- Something for all, everything for none
- No full benefits for a given workload
- Significantly better performance for several

# Example: data layouts

- Prepare Exhaustively: create row, column and all hybrid (vertically partitioned) layouts
- Prepare Selectively: uniformly pick some of the layouts based on their tuple width
- Prepare Partially: create different layouts for different subsets of the data

Advantages

No need to find the optimal

# Can Observe Performance

# Ad-hoc Workload

# Performance of a system (horse) without workload

# Thank You!
