Alexa et al. '00 [ARAP] uses the polar decomposition of the Jacobian, interpolates the parts separately, and then reconstructs the map by finding integrable Jacobians that are close. No guarantees on distortion bounds.

Problem Statement & Basic Approach		
Basic Approach (cont.)		

- Interpolation is achieved with proper choices of integration constants.
- **2** Harmonicity is automatic in our approach.
- 3 Local injectivity follows as long as we maintain $|f_z| > |f_{\bar{z}}|$ throughout interpolation.
- **4** Smoothness will result as long as f_z and $f_{\overline{z}}$ are smoothly interpolated with respect to time *t*.

Implementation & Results		

Some Implementation Details

For results here, input generated with methods of [Chen/Weber 15], i.e., discretized with Cauchy barycentric coordinates.

$$\Phi(z) = \sum_{j=1}^n C_j(z) \varphi_j, \quad \Psi(z) = \sum_{j=1}^n C_j(z) \psi_j$$

The Hilbert transform also performed with Cauchy barycentric coordinates, requiring a multiplication by a small dense matrix.

Otherwise, quantities are blended per vertex in parallel (fineness of mesh can be arbitrarily high), and the integration of f_z and $f_{\overline{z}}$ is done numerically, which turns out to be quite accurate.
