

Scientific Computing

Maastricht Science Program

Week 6

Frans Oliehoek
<frans.oliehoek@maastrichtuniversity.nl>

This Lecture

- Last week:
 - PCA – how?
 - numerical methods for differentiation and integration
- This week
 - Differential Equations
 - Questions

Part 1: Differential Equations

The World is Dynamic

- Many problems studied in science are 'dynamic'
 - change over time
- Examples:
 - change of temperature
 - trajectory of a baseball
 - populations of animals
 - changes of price in stocks or options
- Commonly modeled with *differential equations*
 - (Not to be confused with difference equations)

Example (wikipedia)

Visualization of heat transfer in a pump casing

- created by solving the “heat equation”.
- Heat is generated internally
- cooled at the boundary
 - steady state temperature distribution.

Differential Equations

- Simple growth of bacteria model:

$$r(t) = C p(t)$$

- r – rate of growth
- p – population size

Differential Equations

- Simple growth of bacteria model:

$$r(t) = C p(t)$$

- r – rate of growth
- p – population size

Question to solve:

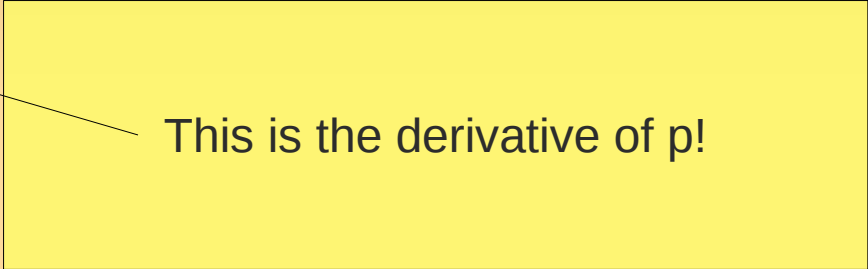

- How many bacteria are there at some time t
- given $p(t_0) = 41$
?
- More general: find $p(t)$ for some range $a < t < b$

Differential Equations

- Simple growth of bacteria model:

$$\frac{dp(t)}{dt} = C p(t)$$

- r – rate of growth
- p – population size

This is the derivative of p !

Differential Equations

- Simple growth of bacteria model:

$$\frac{dp(t)}{dt} = C p(t) \longrightarrow p'(t) = C p(t)$$

- r – rate of growth
- p – population size

Also:

$$\dot{p}(t) = C p(t)$$

$$\dot{p} = C p$$

Differential Equations

- Simple growth of bacteria model:

$$\frac{dp(t)}{dt} = C p(t) \longrightarrow p'(t) = C p(t)$$

- r – rate of growth
 - p – population size
-
- Different types
 - ordinary (**ODEs**) : all derivatives w.r.t. 1 'independent variable' (vs. 'partial DE' with multiple variables)
 - Order of a DE: maximum order of differentiation.

Problem

- Given an ODE

$$y'(t) = f(t, y(t)), \quad \forall t \in I \longrightarrow \text{some time interval}$$

- find a function $y(t)$ that satisfies it.

Problem

- Given an ODE

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

$$f(t, y(t)) = C y(t)$$

- find a function $y(t)$ that satisfies it.

Problem

- Given an ODE

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

$$f(t, y(t)) = C y(t)$$

- find a function $y(t)$ that satisfies it.
- But: there are **infinitely many solutions!**

Direction Fields

- Given an ODE

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

$$f(t, y(t)) = C y(t)$$

- Many functions satisfy it...
- Let's plot the derivatives...

Direction Fields

- Given an ODE

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

$$f(t, y(t)) = C y(t)$$

- Many functions satisfy it...
- Let's plot the derivatives...

Direction Fields

- Given an ODE

- Let's plot the derivatives...

Initial Value problem

- Given an ODE

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

- find a function $y(t)$ that satisfies it.

- Initial Value Problem
(also: 'Cauchy Problem')

- specifies $y(t_0)$
→ unique solution

Initial Value problem

- Initial value problem:

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

$$y(t_0) = y_0$$

- find a function $y(t)$ that satisfies it

Initial Value problem

- Initial value problem:

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$

$$y(t_0) = y_0$$

- find a function $y(t)$ that satisfies it
However...

- closed-form solutions $y(t)$ only available for very special cases.
→ Need for numerical solutions!

Approach

- Discretization: divide interval I in short steps of length h
- At each *node* t_n compute $u_n \approx y(t_n)$
- Numerical solution: $\{u_0, u_1, \dots, u_N\}$

Initial Value problem

- Initial value problem:

$$y'(t) = f(t, y(t)), \quad \forall t \in I$$
$$y(t_0) = y_0$$

- find a function $y(t)$ that satisfies it
However...

- closed-form solutions $y(t)$ only available for very special cases.
→ Need for numerical solutions!

Approach

- Discretization: divide interval I in short steps of length h
- At each *node* t_n compute $u_n \approx y(t_n)$
- Numerical solution: $\{u_0, u_1, \dots, u_N\}$

**Effectively we
perform a
simulation!**

Forward Euler Method

- The forward Euler method
 - just perform the 'simulation'
 - shorthand $f_n = f(t_n, u_n)$

$$u_{n+1} = u_n + hf_n$$

Forward Euler Method

- The forward Euler method
 - just perform the 'simulation'
 - shorthand $f_n = f(t_n, u_n)$

$$u_{n+1} = u_n + hf_n$$

Example

$$u_0 = 12740$$

$$t = (0, 19)$$

$$h = 1$$

$$p(0) = 12740$$

$$r(p) = 0.1 * p$$

Forward Euler Method

- The forward Euler method
 - just perform the 'simulation'
 - shorthand $f_n = f(t_n, u_n)$

$$u_{n+1} = u_n + hf_n$$

Example

$t = (0, 19)$

$h = 1$

$p(0) = 12740$

$r(p) = 0.1 * p$

$$u_0 = 12740$$

$$u_1 = u_0 + h * r(u_0) = 12740 + 1 * 1274.0 = 14014$$

Forward Euler Method

- The forward Euler method
 - just perform the 'simulation'
 - shorthand $f_n = f(t_n, u_n)$

$$u_{n+1} = u_n + hf_n$$

Example

$t = (0, 19)$

$h = 1$

$p(0) = 12740$

$r(p) = 0.1 * p$

$$u_0 = 12740$$

$$u_1 = u_0 + h * r(u_0) = 12740 + 1 * 1274.0 = 14014$$

$$u_2 = u_1 + h * r(u_1) = 14014 + 1 * 1401.4 = 15415.40$$

Computational Issues

- How accurate is this?
- Does it 'converge' ?
- What is the order p of convergence?

Computational Issues

- How accurate is this?

Can we derive an expression for the error?

- Does it 'converge' ?

if $h \rightarrow 0$,
does error $\rightarrow 0$?

- What is the order p of convergence?

Do we have
 $|err| < C(h) = O(h^p)$

Computational Issues

- How accurate is this?

Can we derive an expression for the error?

- Does it 'converge' ?

if $h \rightarrow 0$,
does error $\rightarrow 0$?

- What is the order p of convergence?

- forward Euler method converges with order 1
- roughly: “h twice as small \rightarrow error twice as small”
- the book discusses many methods with higher order.
- Matlab implements many:
 - ode23, ode45, ode113, ode15s, ode23s, ode23t,
ode23tb
- “doc ode23”

Do we have
 $|err| < C(h) = O(h^p)$

Computational Issues

- Do they matter?
 - yes...
- what to use?
Matlab's doc:
“ode45 should be first you try”

Reading

- ODEs: chap. 7 (7.1-7.3)
