Mobility is HUGE…

3.3 Billion mobile phone subscriptions (11/29/07) [Informa]

- 1.3 Billion internet users (900 Million PC users)
  - Mobile devices already outnumber PCs 5:1
  - In some growth markets this is closer to 10:1

- 1.5 Billion TV sets
  - By the end of 2010 ~60M people globally will be watching TV on their mobile phones. (Streaming services > 20M, broadcast networks ~40M.) Infonetics 11/2007

- 1.4 Billion people with credit cards

1.14 Billion handsets sold in 2007

- 456 Million by Nokia
  - 133.5 Million in Q4 (1.5 Million per day, ~17Hz)

2 Billion active users of SMS text messaging ($ 100B in 2007)

- 800 Million active users of email (1.4 Billion email addresses)
Challenge? Power!

Power is the ultimate bottleneck

Usually not plugged to wall, just batteries

Batteries don’t follow Moore’s law

Only 5-10% per year
Gene’s law

"power use of integrated circuits decreases exponentially" over time => batteries will last longer

Since 1994, the power required to run an IC has declined 10x every 2 years

But the performance of 2 years ago is not enough

Pump up the speed

Use up the power savings
Challenge? Thermal mgt!

But ridiculously good batteries still won’t be the miracle cure

The devices are small

Generated power must get out

No room for fans
Challenge? Thermal mgt!

Thermal management must be considered early in the design

- Hot spot would fry electronics
- Or at least inconvenience the user…
- Conduct the heat through the walls, and finally release to the ambient
Changed? Displays!

Resolution

- 84 x 48 -> 176 x 208 -> 320 x 240
- Communicators: 640 x 200 -> 800 x 352
- Internet tablets like N800: 800 x 480

Color depth

- Gray scale: 1 -> 2 -> 4 -> 8 bit
- RGB: 12 -> 16 -> 18 -> 24 bit
Color gamut

**2005:** 38% NTSC gamut
- Nokia 6600

**2006:** 75% NTSC gamut
- Nokia 6131

**2007:** 100% NTSC gamut
- OLED displays
- Nokia 8300
Future? Displays!

Physical size remains limited
TV-out connection
Near-eye displays?
Projectors?
Roll-up flexible displays?

Activision
Mobile 3D APIs

- Native C/C++ Applications
- Java Applications
- M3G (JSR-184)
- OpenGL ES
- Operating System (Symbian, Linux, …)
- Graphics Hardware
- Java Virtual Machine
- Java UI API
Overview: OpenGL ES

Background: OpenGL & OpenGL ES

OpenGL ES 1.0
OpenGL ES 1.1
EGL: the glue between OS and OpenGL ES
How can I get it and learn more?
What is OpenGL?

The most widely adopted graphics standard
most OS’s, thousands of applications
Map the graphics process into a pipeline
matches HW well

A foundation for higher level APIs
Open Inventor; VRML / X3D; Java3D; game engines
What is OpenGL ES?

OpenGL is just too big for Embedded Systems with limited resources
memory footprint, floating point HW
Create a new, compact API
mostly a subset of OpenGL
that can still do almost all OpenGL can
OpenGL ES 1.0 design targets

Preserve OpenGL structure
Eliminate un-needed functionality
    redundant / expensive / unused
Keep it compact and efficient
    <= 50KB footprint possible, without HW FPU
Enable innovation
    allow extensions, harmonize them
Align with other mobile 3D APIs (M3G / JSR-184)
Adoption

Symbian OS, S60
Brew
PS3 / Cell architecture

Sony’s arguments: Why ES over OpenGL
  • OpenGL drivers contain many features not needed by game developers
  • ES designed primarily for interactive 3D app devs
  • Smaller memory footprint
Outline

Background: OpenGL & OpenGL ES
OpenGL ES 1.0
OpenGL ES 1.1
EGL: the glue between OS and OpenGL ES
How can I get it and learn more?
OpenGL ES Pipe

Here's the OpenGL ES pipeline stages:

- Vertices
- Primitives
- Fragments
Vertex pipeline

Vertex buffer ➔ Vertex array ➔ Matrix control

Current color ➔ Current normal ➔ Current vertex ➔ Current texcoord 0 ➔ Current texcoord n-1

Matrix control:
- \( M \)
- \( T_0 \)
- \( \ldots \)
- \( T_{n-1} \)
- \( P \)

Material control ➔ Lighting ➔ Primitive assembly

User clip

User clip plane
Primitive processing

Primitive assembly

User clip

Eye coordinates

Frustum clip

Clip coordinates

Perspective divide

Normalized device coordinates

Viewport transform

Window coordinates

Backface cull

Rasterization & interpolation
Fragment pipeline

Rasterization & interpolation

Texture memory

Texture 0 application
Texel 0 fetch

Texture n-1 application
Texel n-1 fetch

Alpha test
Multi-sample
Scissor test
Coverage generation
Fog
Depth offset

Stencil test
Depth test
Blending
Dithering
Logic Op
Masking

Frame Buffer (Color, Depth, Stencil)

Copy pixels

Read pixels
Functionality: in / out? (1/7)

Convenience functionality is **OUT**

**GLU**
(utility library)

**evaluators**
(for splines)

**feedback mode**
(tell what would draw without drawing)

**selection mode**
(for picking, easily emulated)

**display lists**
(collecting and preprocessing commands)

```
gluOrtho2D(0,1,0,1)
vs.
glOrtho(0,1,0,1,-1,1)

glNewList(1, GL_COMPILE)
myFuncThatCallsOpenGL()
glEndList()

... glCallList(1)
```
Functionality: in / out? (2/7)

Remove old complex functionality

`glBegin` – `glEnd` (**OUT**); vertex arrays (**IN**)

new: coordinates can be given as bytes

```c
static const GLbyte verts[4 * 3] = {
    -1,  1,  1,  1,
    1, -1,  1,  -1,
    1,  1,  1,  1,
};
static const GLubyte colors[4 * 3] = {
    255,  0,  0, 255,
    0, 255,  0,  0,
    255,  0,  0, 255,
};
glVertexPointer( 3, GL_BYTE, 0, verts );
glColorPointerf( 3, GL_UNSIGNED_BYTE, 0, colors );
glDrawArrays( GL_TRIANGLE_STRIP, 0, 4 );
```
Functionality: in / out? (3/7)

Simplify rendering modes
  double buffering, RGBA, no front buffer access

Emulating back-end missing functionality is expensive or impossible
  full fragment processing is \textbf{IN}
    alpha / depth / scissor / stencil tests,
    multisampling,
    dithering, blending, logic ops)
Functionality: in / out? (4/7)

Raster processing

ReadPixels **IN**, DrawPixels and Bitmap **OUT**

Rasterization

**OUT**: PolygonMode, PolygonSmooth, Stipple
Functionality: in / out? (5/7)

2D texture maps **IN**

1D, 3D, cube maps **OUT**

borders, proxies, priorities, LOD clamps **OUT**

multitexturing, texture compression **IN** (optional)

texture filtering (incl. mipmaps) **IN**

new: paletted textures **IN**
Functionality: in / out? (6/7)

Almost full OpenGL light model **IN**
- back materials, local viewer, separate specular **OUT**

**Primitives**

**IN:** points, lines, triangles
**OUT:** quads & polygons
Functionality: in / out? (7/7)

Vertex processing

**IN:** transformations

**OUT:** user clip planes, texcoord generation

Support only static queries

**OUT:** dynamic queries, attribute stacks

application can usually keep track of its own state
Floats vs. fixed-point

Accommodate both

- integers / fixed-point numbers for efficiency
- floats for ease-of-use and being future-proof

Details

- 16.16 fixed-point: add a decimal point inside an int

```
glRotatef( 0.5f, 0.f, 1.f, 0.f );
vs.

glRotatex( 1 << 15, 0, 1 << 16, 0 );
```

get rid of doubles
Outline

Background: OpenGL & OpenGL ES

OpenGL ES 1.0

OpenGL ES 1.1

EGL: the glue between OS and OpenGL ES

How can I get it and learn more?
OpenGL ES 1.1: core

Buffer Objects
allow caching vertex data

Better Textures
>= 2 tex units, combine (+,-,interp), dot3 bumps, auto mipmap gen.

User Clip Planes
portal culling (>= 1)

Point Sprites
particles as points not quads, attenuate size with distance

State Queries
enables state save / restore for middleware
Bump maps

Double win

increase realism

reduce internal bandwidth -> increase performance
OpenGL ES 1.1: optional

Draw Texture
- fast drawing of pixel rectangles
- using texturing units
- (data can be cached),
- constant Z, scaling

Matrix Palette
- vertex skinning
- (>= 3 matrices / vertex, palette >= 9)
Outline

Background: OpenGL & OpenGL ES
OpenGL ES 1.0
OpenGL ES 1.1
EGL: the glue between OS and OpenGL ES
How can I get it and learn more?
EGL glues OpenGL ES to OS

EGL is the interface between OpenGL ES and the native platform window system
similar to GLX on X-windows, WGL on Windows
facilitates portability across OS’s (Symbian, Linux, …)

Division of labor

EGL gets the resources (windows, etc.) and displays the images created by OpenGL ES
OpenGL ES uses resources for 3D graphics
EGL surfaces

Various drawing surfaces, rendering targets

- **windows** – on-screen rendering
  (“graphics” memory)

- **pbuffers** – off-screen rendering
  (during rendering “graphics” memory)

- **pixmaps** – off-screen rendering
  (OS native images)
EGL context

A rendering context is an abstract OpenGL ES state machine
- stores the state of the graphics engine
- can be (re)bound to any matching surface
- different contexts can share data
  - texture objects
  - vertex buffer objects
- even across APIs (OpenGL ES, OpenVG, later others too)
Main EGL 1.0 functions

Getting started

eglInitialize() / eglTerminate(), eglGetDisplay(),
eglGetConfigs() / eglChooseConfig(),
eglCreateXSurface() (X = Window | Pbuffer | Pixmap),
eglCreateContext()

eglMakeCurrent( display, drawsurf, readsurf, context )

binds context to current thread, surfaces, display
Main EGL 1.0 functions

eglSwapBuffer( display, surface )
   posts the color buffer to a window

eglWaitGL( ), eglWaitNative( engine )
   provides synchronization between OpenGL ES and native (2D) graphics libraries

eglCopyBuffer( display, surface, target )
   copy color buffer to a native color pixmap
EGL 1.1 enhancements

Swap interval control

specify # of video frames between buffer swaps
default 1; 0 = unlocked swaps, >1 save power

Power management events

PowerMgmnt event => all Context lost
Display & Surf remain, Surf contents unspecified

Render-to-texture [optional]

flexible use of texture memory
Outline

Background: OpenGL & OpenGL ES
OpenGL ES 1.0 functionality
OpenGL ES beyond 1.0
EGL: the glue between OS and OpenGL ES
How can I get it and learn more?
SW Implementations

Vincent

Open-source OpenGL ES library

http://www.vincent3d.com/
http://sourceforge.net/projects/ogl-es

Reference implementation

Wraps on top of OpenGL

http://www.khronos.org/opengles/documentation/gles-1.0c.tgz
HW implementations

There are many designs

The following slides gives some idea

rough rules of thumb

from a couple to dozens of MTri / sec (peak)

1 pixel / clock (high end growing…)

clock speeds 50MHz – 200+MHz -> 750 MHz

power consumption should be ~ 10’s of mW
Bitboys

Graphics processors

**G12:** OpenVG 1.0

**G34:** OpenGL ES 1.1

**G40:** OpenGL ES 2.0, GLSL

OpenVG 1.0 vertex and pixel shader

Flipquad antialiasing

Max clock 200MHz

ARM bought Falanx
ARM® Mali™ Architecture

- Compared to traditional immediate mode renderer
  - 80% lower per pixel bandwidth usage, even with 4X FSAA enabled
  - Efficient memory access patterns and data locality: enables performance even in high latency systems
- Compared to traditional tile-based renderer
  - Significantly lower per-vertex bandwidth
  - Impact of scene complexity increases is substantially reduced
- Other architectural advantages
  - Per frame autonomous rendering
  - No renderer state change performance penalty
  - On-chip z / stencil / color buffers
    - minimizes working memory footprint
  - Acceleration beyond 3D graphics (OpenVG etc.)

■ PICA graphics core

■ 3D Features
  ■ OpenGL ES 1.1
  ■ DMP’s proprietary “Maestro” shader extensions
    • Very high quality graphics with easier programming interface

■ Hardware Features
  » Performance: 40Mtri/s, 400Mpixel/s@100MHz
  » Power consumption: 0.5-1mW/MHz
  » Max. clock freq. 400MHz (65nm)
Fujitsu Graphics Controllers

- **Optimized for automotive environment**
  - Extended temp range (-40...+85degC or -40...+105degC)
  - No external active or passive cooling required
  - Long term availability (devices from 1998 still in full mass production!)
  - Fulfills the latest qualification requirements from automotive industry
  - Automotive network interfaces included on-chip
  - Dedicated competence center in Munich for automotive graphics

- **Used in many major car brands for:**
  - Onboard navigation systems (2D and 3D)
  - Cluster Instrumentation (incl. virtual dashboards)
  - Rear seat entertainment systems
  - Head-up displays
  - Night vision systems

- **Also used today in:**
  - Flight instrumentation
  - Marine displays
  - Medical, etc...

Programmable shader

Plan to support OpenGL ES2.0

Large embedded memory for

- Color and Z buffer
- Caches for vertex arrays, textures
- Display lists (command buffer)

50M vtx / sec, 400M pix / sec (@ 100 MHz)

- clocks up to 200MHz

WVGA LCD controller

13mm x 13mm x 1.2mm 449Ball BGA
Vivante GPU for Handheld

- OpenGL ES 1.1 & 2.0 and D3D 9.0
- Unified vertex & pixel shader
- Anti-Aliasing
- AXI/AHB interface
- GC500
  - 3 mm² die area in 65nm (1.8mm x 1.2mm)
  - 10 MPolygons/s and 100 MPixel/s at 200 MHz
  - 50mW GPU core power
- Scalable solution to 50 MPolygons/s and 1 GPixels/s (GC1000, GC4000)
- Silicon proven solution
- Designed into multiple 65nm SoCs

- Converting existing code
“Hello OpenGL ES”
Hello OpenGL ES, EGL initialization

/* ==============================================================
 * "Hello OpenGL ES" OpenGL ES code.
 * *
 * Eurographics 2008 tutorial.
 * *
 * Copyright: Jani Vaarala
 * ==============================================================*/

#include <GLES/gl.h>
#include <GLES/egl.h>

EGLDisplay display;
EGLContext context;
EGLSurface surface;
EGLConfig config;
Hello OpenGL ES, EGL initialization

```c
EGLint attrib_list[] = {
    EGL_BUFFER_SIZE, 16,
    EGL_DEPTH_SIZE, 15,
    EGL_SURFACE_TYPE, EGL_WINDOW_BIT,
    EGL_NONE
};

void init_egl(void)
{
    EGLint numOfConfigs;

    display = eglGetDisplay( EGL_DEFAULT_DISPLAY );
    eglInitialize( display, NULL, NULL );
    eglChooseConfig( display, attrib_list, &config, 1, &numOfConfigs );
    surface = eglCreateWindowSurface( display, config, WINDOW(), NULL );
    context = eglCreateContext( display, config, EGL_NO_CONTEXT, NULL );
    eglMakeCurrent( display, surface, surface, context );
}
```
Hello OpenGL ES, OpenGL ES part

#include <GLES/gl.h>

static const GLubyte vertices[3 * 3] =
{
    -1,  1,  0,
    1,  -1,  0,
    1,   1,  0
};

static const GLubyte colors[3 * 4] =
{
    255, 0, 0, 255,
    0, 255, 0, 255,
    0, 255, 0, 255
};
Hello OpenGL ES, OpenGL ES part

```c
void init( )
{
    glClearColor ( 0.f, 0.f, 0.1f, 1.f );
    glMatrixMode ( GL_PROJECTION );
    glFrustumf          ( -1.f, 1.f, -1.f, 1.f, 3.f, 1000.f );
    glMatrixMode        ( GL_MODELVIEW );
    glShadeModel        ( GL_SMOOTH );
    glDisable ( GL_DEPTH_TEST );
    glVertexPointer     ( 3,  GL_BYTE, 0, vertices );
    glColorPointer      ( 4, GL_UNSIGNED_BYTE, 0, colors );
    glEnableClientState ( GL_VERTEX_ARRAY );
    glEnableClientState ( GL_COLOR_ARRAY );
    glViewport ( 0, 0, GET_WIDTH(), GET_HEIGHT() );

    INIT_RENDER_CALLBACK(drawcallback);
}
```
void drawcallback(void)
{
    glClear ( GL_COLOR_BUFFER_BIT );
    glLoadIdentity ( );
    glTranslatef ( 0.f, 0.f, -5.f );
    glDrawArrays ( GL_TRIANGLES, 0, 3 );

    eglSwapBuffers( display, surface );
}
## EGL config sorting

<table>
<thead>
<tr>
<th>ATTRIBUTE</th>
<th>DEFAULT VALUE</th>
<th>SELECTION RULE</th>
<th>SORT PRIORITY</th>
<th>SORT ORDER</th>
</tr>
</thead>
<tbody>
<tr>
<td>EGL_BUFFER_SIZE [16]</td>
<td>0</td>
<td>AtLeast</td>
<td>3</td>
<td>Smaller</td>
</tr>
<tr>
<td>EGL_DEPTH_SIZE [15]</td>
<td>0</td>
<td>AtLeast</td>
<td>6</td>
<td>Smaller</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Selection rule: minimum requirement
Sort priority: which attrib is sorted first
Sort order: how attrib is sorted
One way of sorting
Not optimal for all applications
Example of sorted list of configs

<table>
<thead>
<tr>
<th>EGL_CONFIG_ID</th>
<th>EGL_BUFFER_SIZE (Sort priority = 3)</th>
<th>EGL_DEPTH_SIZE (Sort priority = 6)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>16</td>
<td>15</td>
</tr>
<tr>
<td>2</td>
<td>16</td>
<td>32</td>
</tr>
<tr>
<td>40</td>
<td>24</td>
<td>15</td>
</tr>
<tr>
<td>11</td>
<td>32</td>
<td>15</td>
</tr>
<tr>
<td>3</td>
<td>32</td>
<td>32</td>
</tr>
<tr>
<td>30</td>
<td>32</td>
<td>32</td>
</tr>
</tbody>
</table>

Sorted first, smaller comes first
Sorted next, smaller comes first
Sorted last (if otherwise no unique order exists), smaller comes first
Example EGL config selection

```c
EGLConfig select_config(int type, int color_bits, int depth_bits, int stencil_bits) {
    EGLBoolean err;
    EGLint amount, attrib_list[5*2]; /* fits 5 attrs */
    EGLConfig best_config, configs[64]; /* max 64 configs considered */
    EGLint *ptr;

    ptr = &attrib_list[0];

    /* Make sure that the config supports target surface type */
    *ptr++ = EGL_SURFACE_TYPE;
    *ptr++ = type;

    /* For color, we require minimum of <color_bits> bits */
    *ptr++ = EGL_BUFFER_SIZE;
    *ptr++ = color_bits;

    /* For depth, we require minimum of <depth_bits> bits */
    if(depth_bits)
    {
        *ptr++ = EGL_DEPTH_SIZE;
        *ptr++ = depth_bits;
    }

```
if(stencil_bits)
{
    ptr[0] = EGL_STENCIL_SIZE;
    ptr[1] = stencil_bits;
    ptr[2] = EGL_NONE;
}
else{
    ptr[0] = EGL_NONE;
}

err = eglChooseConfig( display, &attrib_list[0], &configs[0], 64, &amount );

if(amount == 0)
{
    /* If we didn't have get any configs, try without stencil */
    ptr[0] = EGL_NONE;
    err = eglChooseConfig( display, &attrib_list[0], &configs[0], 64, &amount );
}
if(amount &gt; 0)
{
    /* We have either configs w/ or w/o stencil, not both. Find one with best AA */
    int i,best_samples;
    best_samples = 0;
    best_config = configs[0];

    for(i=0 ; i&lt;amount ; i++)
    {
        int samp;
        eglGetConfigAttrib(display, configs[i], EGL_SAMPLES, &amp;samp );
        if(samp &gt; best_samples)
        {
            best_config = configs[i];
            best_samples = samp;
        }
    }
    else best_config = (EGLConfig)0; /* no suitable configs found */

    return best_config;
}
Texture matrix example (target)
void appinit_glass(void)
{
    GLint texture_handle;

    /* View parameters */
    glMatrixMode ( GL_PROJECTION );
    glFrustumf                 ( -1.f, 1.f, -1.f, 1.f, 3.f, 1000.f );
    glMatrixMode            ( GL_MODELVIEW );

    /* Reset state */
    glEnable                   ( GL_DEPTH_TEST );
    glClearColor              ( 0.f, 0.f, 0.1f, 1.f );

    /* Enable vertex arrays */
    glEnableClientState  ( GL_VERTEX_ARRAY );
    glEnableClientState ( GL_TEXTURE_COORD_ARRAY );
Texture matrix example

/* Setup texture */
glEnable  ( GL_TEXTURE_2D );

glGenTextures  ( 1, texture_handle );
glBindTexture  ( GL_TEXTURE_2D, texture_handle );
glTexImage2D  ( GL_TEXTURE_2D, 0, GL_RGB, 256, 256, 0,
                GL_RGB, GL_UNSIGNED_BYTE, texture_data );
glTexEnvi  ( GL_TEXTURE_ENV, GL_TEXTURE_ENV_MODE,
                GL_MODULATE );
glTexParameteri  ( GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER,
                    GL_LINEAR );
glTexParameteri  ( GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER,
                    GL_LINEAR );
glTexParameteri  ( GL_TEXTURE_2D, GL_TEXTURE_WRAP_S,
                    GL_CLAMP_TO_EDGE );
glTexParameteri  ( GL_TEXTURE_2D, GL_TEXTURE_WRAP_T,
                    GL_CLAMP_TO_EDGE );
}
Texture matrix example

```c
int render(float time)
{
    glClear ( GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT );

    /* draw background with two textured triangles */
    glMatrixMode ( GL_TEXTURE );
    glLoadIdentity ( );
    glMatrixMode ( GL_PROJECTION);
    glLoadIdentity ( );
    glMatrixMode ( GL_MODELVIEW);
    glLoadIdentity ( );
    glColor4ub ( 255, 255, 255, 255 );
    glScalef ( 2.f, -2.f, 0.f );
    glTranslatef ( -0.5f, -0.5f, 0.f );
    glVertexPointer ( 2, GL_BYTE, 0, back_coords );
    glTexCoordPointer ( 2, GL_BYTE, 0, back_coords );
    glDrawArrays ( GL_TRIANGLE_STRIP, 0, 4 );
}
```
Texture matrix example, coordinates

Texture "normals"

Vertex coordinates
Texture matrix example, coordinates

We just take the (x,y) of the texture coordinate output
Texture matrix example, coordinates

These areas are not used
Texture matrix example, coordinates

In this example we use the same data for vertex and texture ”normals” as the object is cut away from roughly tessellated sphere (all coordinates unit length)

This is NOT possible for general objects. You should use separate normalized normals for other objects
Texture matrix example

```c
glMatrixMode ( GL_PROJECTION );
glLoadIdentity ( );
glFrustumf ( -1.f, 1.f, -1.f, 1.f, 3.f, 1000.f );

glMatrixMode ( GL_MODELVIEW );
glLoadIdentity ( );
glTranslatef ( 0, 0, -5.f );
glRotatef ( time*25, 1.f, 1.f, 0.f ); /* (1) */
glRotatef ( time*15, 1.f, 0.f, 1.f );

glMatrixMode ( GL_TEXTURE );
glLoadIdentity ( );
glTranslatef ( 0.5f, 0.5f, 0.f ); /* [-0.5,0.5] -> [0,1] */
glScalef ( 0.5f, -0.5f, 0.f ); /* [-1,1] -> [-0.5,0.5] */
glRotatef ( time*25, 1.f, 1.f, 0.f ); /* identical rotations! */
glRotatef ( time*15, 1.f, 0.f, 1.f ); /* see (1) */```
Texture matrix example

/* use different color for the (glass) object vs. the background */
glColor4ub ( 255, 210, 240, 255 );
glVertexPointer ( 3,GL_FIXED, 0, vertices );
glTexCoordPointer ( 3,GL_FIXED, 0, vertices );
glDrawArrays ( GL_TRIANGLES, 0, 16*3 );
}
Fixed point programming

Why should you use it?
Most mobile handsets don’t have a FPU

Where does it make sense to use it?
Where it makes the most difference
For per-vertex processing: morphing, skinning, etc.
Per vertex data shouldn’t be floating point

OpenGL ES API supports 32-bit FP numbers
Fixed point programming

There are many variants of fixed point:

- Signed / Unsigned
- 2’s complement vs. Separate sign

OpenGL ES uses 2’s complement

Numbers in the range of \([-32768, 32768]\]

16 bits for decimal bits (precision of \(1/65536\))

All the examples here use 16.16 fixed point
Fixed point programming

Examples:

\[ 0x0001 \ 0000 = 65536 = "1.0f" \]
\[ 0x0002 \ 0000 = 2 \times 65536 = "2.0f" \]
\[ 0x0010 \ 0000 = 16 \times 65536 = "16.0f" \]
\[ 0x0000 \ 0001 = \frac{1}{65536} = "0.0000152587..." \]
\[ 0xffffff \ ffff = -\frac{1}{65536}(-0x0000 \ 0001) \]

Imaginary decimal point location
Float to fixed and vice versa

Convert from floating point to fixed point

#define float_to_fixed(a)  (int)((a)*(1<<16))   or
#define float_to_fixed(a)  (int)((a)*(65536))

Convert from fixed point to floating point

#define fixed_to_float(a)  (((float)a)/(1<<16)) or
#define fixed_to_float(a)  (((float)a)/(65536))
Fixed point operations

Addition

#define add_fixed_fixed(a,b) ((a)+(b))

Multiply fixed point number with integer

#define mul_fixed_int(a,b) ((a)*(b))

MUL two FP numbers together

#define mul_fixed_fixed(a,b) \ 
  (int)(((int64)a)*((int64)b)) >> 16)
Fixed point operations and scale

Addition:

\[ a \& b = \text{original float values} \]

\[ S = \text{fixed point scale (e.g., 65536)} \]

\[ \text{result} = (a \times S) + (b \times S) = (a + b) \times S \]

Scaling term keeps the same

Range of the result is 33 bits

Possible overflow by 1 bit
Fixed point operations and scale

Multiplication:

\[ a \& b = \text{original float values} \]
\[ S = \text{fixed point scale (e.g., 65536)} \]

result \[= (a \times S) \times (b \times S) = ((a \times b) \times S^2) \]

final \[= ((a \times b) \times S^2) / S = (a \times b) \times S \]

Scaling term is squared \((S^2)\) and takes 32 bits
Also the integer part of the multiplication takes 32 bits
Rightarrow need 64 bits for full \text{s16.16 * s16.16 multiply}
Fixed point programming

Intermediate overflow
• Higher accuracy (64-bit)
• Downscale input
• Redo range analysis

```
VALUE 1
32-bit

VALUE 2
32-bit

64-bit

>> 16 =
```

RESULT
48-bit

Result overflow (48 bits)
• Redo range analysis
• Detect overflow, clamp
Fixed point programming

Division of integer by integer to a fixed point result

```c
#define div_int_int_int(a,b)  
(int)((((int64)a)*(1<<16))/(b))
```

\[(a*S)/b = (a/b)*S\]

Division of fixed point by integer to a fixed point result

```c
#define div_fixed_int_int(a,b) ((a)/(b))
```

Division of fixed point by fixed point

```c
#define div_fixed_fixed_fixed(a,b)  
(int)((((int64)a)*(1<<16))/(b))
```

\[(a*S*S)/(b*S) = (a/b)*S\]
Fixed point programming

Power of two MUL & DIV can be done with shifts

\[ a \times 65536 = a \ll 16, \quad a / 256 = a \gg 8 \]

Fixed point calculations overflow easily

Careful analysis of the range requirements is required

=>

Always add validation code to your fixed point code
Fixed point programming

```c
#if defined(DEBUG)
int add_fix_fix_chk(int a, int b)
{
    int64 bigresult = ((int64)a) + ((int64)b);
    int smallresult = a + b;
    assert(smallresult == bigresult);
    return smallresult;
}
#endif

#if defined(DEBUG)
#define add_fix_fix(a,b) add_fix_fix_chk(a,b)
#else
#define add_fix_fix(a,b) ((a)+(b))
#endif
```
Fixed point math functions

Complex math functions
   Pre-calculate for the range of interest

An example: Sin & Cos
   Sin table between [ 0, 90° ], fixed point angle (S = 2048)
   Generate other angles and Cos from the table
   Store in a short table (16-bit) as s0.16 (S = 32768)
   Range for shorts is [-32768,32767] ([-1.0, 1.0[ for s0.16 FP)
   Equals to [-1.0, +1.0[ for s0.16 FP ( +1.0 not included !)
   Negative values stored in the table (can represent -1.0)
Example: Simple morphing (LERP)

Simple fixed point morphing loop (16-bit data, 16-bit coeff )

```c
#define DOLERP_16(a,b,t) (short)(((b)-(a))*(t))>>16)+(a))

void lerpgeometry(short *out, const short *inA, const short *inB, int count, int scale)
{
    int i;

    for(i=0; i<count; i++)
    {
        out[i*3+0] = DOLERP_16(inB[i*3+0], inA[i*3+0], scale);
        out[i*3+1] = DOLERP_16(inB[i*3+1], inA[i*3+1], scale);
        out[i*3+2] = DOLERP_16(inB[i*3+2], inA[i*3+2], scale);
    }
}
```
Converting existing code

OS/device conversions

Programming model, C/C++, compiler, CPU

Windowing API conversion

EGL API is mostly cross platform
EGL Native types are platform specific

OpenGL -> OpenGL ES conversion
Example: Symbian porting

Programming model

- C++ with some changes (e.g., exceptions)
- Event based programming (MVC), no main / main loop
- Three level multitasking: Process, Thread, Active Objects

ARM CPU

- Unaligned memory accesses will cause exception (unlike x86)

OpenC (http://www.forum.nokia.com/openc)
Example: EGL porting

Native types are OS specific

- EGLNativeWindowType (RWindow *)
- EGLNativePixmapType (CFbsBitmap *)

Pbuffers are portable

Config selection

- Select the color depth to be same as in the display

Windowing system issues

- What if render window is clipped by a system dialog?
- Only full screen windows may be supported
OpenGL porting

- **glBegin/glEnd wrappers**
  - `_glBegin` stores the primitive type
  - `_glColor` changes the current per-vertex data
  - `_glVertex` stores the current data behind arrays and increments
  - `_glEnd` calls `glDrawArrays` with primitive type and length

```c
 glBegin(GL_TRIANGLES);  
 _glColor4f(1.0,0.0,0.0,1.0);  
 _glVertex3f(1.0,0.0,0.0);  
 _glVertex3f(0.0,1.0,0.0);  
 _glColor4f(0.0,1.0,0.0,1.0);  
 _glVertex3f(0.0,0.0,1.0);  
 glEnd();
```
OpenGL porting

Display list wrapper

- Add the display list functions as wrappers
- Add all relevant GL functions as wrappers
- When drawing a list, go through the collected list
OpenGL porting

```c
void _glEnable( par1, par2 )
{
    if( GLOBAL()->iSubmittingDisplayList )
    {
        *(GLOBAL())->dlist)++ = DLIST_CMD_GLENABLE;
        *(GLOBAL())->dlist)++ = (GLuint)par1;
        *(GLOBAL())->dlist)++ = (GLuint)par2;
    }
    else
    {
        glEnable(par1,par2);
    }
}
```
OpenGL porting

Vertex arrays

OpenGL ES supports only vertex arrays
SW implementations get penalty from float data
Use as small types as possible (byte, short)
For HW it shouldn’t make a difference, mem BW
With OpenGL ES 1.1 always use VBOs
OpenGL porting

No quads
  Convert a quad into 2 triangles

No real two-sided materials in lighting
  If you really need it, submit front and back triangles

OpenGL ES and querying state
  OpenGL ES 1.0 only supports static getters
  OpenGL ES 1.1 supports dynamic getters
  For OpenGL ES 1.0, create own state tracking if needed
Demo

Quake2 from ID Software

Ported by Olli Hinkka to S60 and OpenGL ES

Runs on Nokia N95 8GB

Current set of HW accelerated S60 devices:

N93, N93i, N95 (multiple variants), N82, E90

    glVertexPointerb( self.vertices )
    glColorPointerub( self.colors )
    glEnableClientState( GL_VERTEX_ARRAY )
    glEnableClientState( GL_COLOR_ARRAY )
def redraw(self, frame=None):
    if self.canvas:
        glClear( GL_COLOR_BUFFER_BIT )
        glLoadIdentity()
        glTranslatef( 0.0, 0.0, -5.0 )
        glRotatef   ( self.angle, 0.0, 0.0, 1.0 )
        glRotatef   ( self.frame, 0.0, 1.0, 0.0 )
        glDrawArrays( GL_TRIANGLES, 0,3 )
        self.frame += 1
Using the class

```python
appuifw.app.screen = 'full'
try:
    app = Hello()
except Exception, e:
    appuifw.note( u"Cannot start: %s" % (e) )
else:
    app.run()

del app
```
OpenGL ES Performance Considerations

Ville Miettinen
Targeting the "mobile platform"

CPU speed and available memory varies

- Current range ~30Mhz - 600+ MHz, ARM7 to ARM11
- From no FPUs to SIMD FPUs

Different resolutions

- QCIF (176x144) to VGA (640x480) and beyond, antialiasing on higher-end devices
- Color depths 4-8 bits per channel (12-32 bpp)

Portability issues

- Different CPUs, OSes, Java VMs, C compilers, ...
- OpenKODE from the Khronos Group will help to some extent
Graphics capabilities

General-purpose multimedia hardware
  Pure software renderers (all done using CPU & integer ALU)
  Software + DSP / WMMX / FPU / VFPU
  Multimedia accelerators

Dedicated 3D hardware
  Software T&L + HW tri setup / rasterization
  Full hardware acceleration
  Performance: 50K – 2M tris, 1M – 100M pixels / sec
  Next gen: 30M+ tris, 1000M pixels / sec
Standards help somewhat

Act as hardware abstraction layers
  Provide programming interface (API)
  Same feature set for different devices
  Unified rendering model

Performance cannot be guaranteed
Scalability

Successful application has to run on hundreds of different phone models

No single platform popular enough

Same gameplay but can scale video and audio

Design for lowest-end, add eye candy for high-end

Scalability has to be built into the design
3D content is easy to scale

Separate low and high poly count 3D models
Different texture resolutions & compressed formats
Rendering quality can be scaled
  Texture filtering, perspective correction, blend functions, multi-texturing, antialiasing
Special effects

Identify special effects

- Bullet holes, skid marks, clouds, ...
- Cannot have impact on game play
  - Fog both gameplay and visual element
  - Multiplayer games have to be fair

Users can alter performance by controlling effects
Tuning down the details

Particle systems
- Number of particles, complexity, visuals
- Shared rendering budget for all particle systems

Background elements
- Collapse into sky cubes, impostors

Detail objects
- Models to have “important” and “detail” parts
Profiling

Performance differences often system integration issues - not HW issues

Measuring is the only effective way to find out how changes in code affect performance

Profile on actual target device if possible

Public benchmark apps provide some idea of graphics performance

gDEBugger ES for gfx driver profiling
Identifying bottlenecks

Three groups: application code, vertex pipeline, pixel pipeline
  
  Further partitioned into pipeline stages
  
  Overall pipeline runs as fast as its slowest stage

Locate bottlenecks by going through each stage and reducing its workload
  
  If performance changes, you have a bottleneck

Apps typically have multiple bottlenecks
Pixel pipeline bottlenecks

Find out by changing rendering resolution
   If performance increases, you have a bottleneck
   Either texturing or frame buffer accesses

Remedies
   Smaller screen resolution, render fewer objects,
   use simpler data formats, smaller texture maps,
   less complex fragment and texture processing
Vertex pipeline bottlenecks

Vertex processing or submission bottlenecks

Find out by rendering every other triangle but using same vertex arrays

Remedies

Submission: smaller data formats, cache-friendly organization, fewer triangles

Vertex processing: simpler T&L (fewer light sources, avoid dynamic lighting and fog, avoid floating-point data formats)
Application code bottlenecks

Two ways to find out

- Turn off all application logic
- Turn off all rendering calls

Floating-point code #1 culprit

Use profiler

- HW profilers on real devices costly and hard to get
- Carbide IDE from Nokia (S60 and UIQ Symbian)
- Lauterbach boards
- Desktop profiling (indicative only)
Changing and querying the state

Rendering pipes are one-way streets

Apps should know their own state

- Avoid dynamic getters if possible!

Perform state changes in a group at the beginning of a frame

Avoid API synchronization

- Do not mix 2D and 3D libraries!
"Shaders"

Combine state changes into blocks ("shaders")

- Minimize number of shaders per frame
- Typical application needs only 3-10 "pixel shaders"
  - Different 3-10 shaders in every application
  - Enforce this in artists’ tool chain

Sort objects by shaders every frame

- Split objects based on shaders
Complexity of shaders

Software rendering: everything costs!
- Important to keep shaders as simple as possible
  - Even if introduces additional state changes
    - Example: turn off fog & depth buffering when rendering overlays

Hardware rendering: Usually more important to keep number of changes small
Model data

Keep vertex and triangle data short and simple!
  Better cache coherence, less memory used
Make as few rendering calls as possible
  Combine strips with degenerate triangles
Weld vertices using off-line tool
Order triangle data coherently
Use hardware-friendly data layouts
  Buffer objects allow storing data on server
Transformation pipeline

Minimize matrix changes
- Changing a matrix may involve many hidden costs
- Combine simple objects with same transformation
- Flatten and cache transformation hierarchies

ES 1.1: Skinning using matrix palettes
- CPU doesn’t have to touch vertex data

ES 1.1: Point sprites for particle effects
Rendering pipeline

Rendering order is important

- Front-to-back improves depth buffering efficiency
- Also need to minimize number of state changes!

Use culling to speed up rendering pipeline

Conservative: frustum culling & occlusion culling

- Portals and Potentially Visible Sets good for mobile

Aggressive culling

- Bring back clipping plane in, drop detail & small objects
Lighting

Fixed-function lighting pipelines are so 1990s

- Drivers implemented badly even in desktop space
- In practice only single directional light fast
- OpenGL’s attenuation model difficult to use
- Spot cutoff and specular model cause aliasing
- No secondary specular color
- Flat shading sucks
- Artifacts unless geometry heavily tessellated
Lighting (if you have to use it)

- Single directional light usually accelerated
- Pre-normalize vertex normals
- Avoid homogeneous vertex positions
- Turn off specular illumination
- Avoid distance attenuation
- Turn off distant non-contributing lights
Lighting: the fast way

While we’re waiting for OpenGL ES 2.0 drivers

Pre-computed vertex illumination good if slow T&L

Illumination using texturing

  Light mapping

  ES 1.1: dot3 bump mapping + texture combine

  Less tessellation required

Combining with dynamic lighting: color material tracking
Textures

Mipmaps always a Good Thing™

- Improved cache coherence and visual quality
- ES 1.1 supports auto mipmap generation

Avoid modifying texture data

Keep textures "right size", use compressed textures

Different strategies for texture filtering & perspective correction

- SW implementations affected
Textures (cont’d)

Multitexturing
- Always faster than doing multiple rendering passes
- ES 1.1: support at least two texturing units
- ES 1.1: TexEnvCombine neat toy

Use small & compressed texture formats

Texture atlases: combining multiple textures
- Reduces texture state changes

gl_FragColor
The vertex shader can do:

- Transformation of position using model-view and projection matrices
- Transformation of normals, including renormalization
- Texture coordinate generation and transformation
- Per-vertex lighting
- Calculation of values for lighting per pixel
The Vertex Shader

The vertex shader cannot do:

- Anything that requires information from more than one vertex
- Anything that depends on connectivity.
- Any triangle operations (e.g. clipping, culling)
- Access colour buffer
The Fragment Shader

The fragment shader can do:

- Texture blending
- Fog
- Alpha testing
- Dependent textures
- Pixel discard
- Bump and environment mapping
The Fragment Shader

The fragment shader cannot do:

- Blending with colour buffer
- ROP operations
- Depth or stencil tests
- Write depth
GLSL ES

Robert J. Simpson
AMD
GLSL ES Overview

Based on GLSL as used in OpenGL 2.0
  Open standard
Pure programmable model
  Most fixed functionality removed.
Not 100% backward compatible with ES1.x
  Embedded systems do not have the legacy requirements of the desktop
No Software Fallback
  Implementations (usually) hardware or nothing
  Running graphics routines in software doesn’t make sense on embedded platforms
Optimized for use in Embedded devices
  Aim is to reduce silicon cost
  Reduced shader program sizes
  Reduced register usage
  Reduced numeric precision
GLSL ES Overview

‘C’ – like language
Many simplifications
  No pointers
  Strongly typed. No implicit type conversion
  Simplified preprocessor
Some graphics-specific additions
  Built-in vector and matrix types
  Built-in functions
  Support for mixed precisions
  Invariance mechanism.
Differences from Desktop OpenGL
  Restrictions on shader complexity
  Fewer sampler modes

## GLSL ES Overview

### Scalar

- void
- float
- int
- bool

### Vector

- boolean:
  - bvec2
  - bvec3
  - bvec4
- integer:
  - ivec2
  - ivec3
  - ivec4
- floating point:
  - vec2
  - vec3
  - vec4

### Matrix

- floating point:
  - mat2
  - mat3
  - mat4

### Sampler

- sampler2D

### Containers

- Structures: struct
- Arrays: []
GLSL ES Storage Qualifiers

const
Local constants within a shader.

uniform
‘Constant shader parameters’ (light position/direction, texture units, …)
Do not change per vertex.

attribute
Per-vertex values (position, normal,…)

varying
Generated by vertex shader
Interpolated by the rasterizer to generate per pixel values
Used as inputs to Fragment Shader
e.g. texture coordinates
Function Parameter Qualifiers

Used to pass values in or out or both e.g.

```cpp
bool f(in vec2 in_v, out float ret_v)
{
    ...
}
```

Qualifiers:

- `in` Input parameter. Variable can be modified
- `const in` Input parameter. Variable cannot be modified
- `out` Output parameter
- `inout` Input and output parameter

Functions can still return a value
But need to use a parameter if returning an array
Function Parameter Qualifiers

Call by value ‘copy in, copy out’ semantics.

Not quite the same as C++ references:

```c
bool f(inout float a, b)
{
    a++;  
    b++;  
}

void g()
{
    float x = 0.0;
    f(x,x);             // x = 1.0 not 2.0
}
GLSL ES Overview

Order of copy back is undefined

```cpp
bool f(inout float a, b)
{
    a = 1.0;
    b = 2.0;
}

void g()
{
    float x ;
    f(x,x);   // x = 1.0 or 2.0
    // (undefined)
}
```
Precision Qualifiers

**lowp float**
Effectively sign + 1.8 fixed point.
Range is -2.0 < x < 2.0
Resolution 1/256
Use for simple colour blending

**mediump float**
Typically implemented by sign + 5.10 floating point
-16384 < x < 16384
Resolution 1 part in 1024
Use for HDR blending.
Precision Qualifiers

**highp float**

- Typically implemented by 24 bit float (16 bit mantissa)
- range $\pm 2^{62}$
- Resolution 1 part in $2^{16}$
- Use of texture coordinate calculation
  - e.g. environment mapping

**single precision (float32)**

- Not explicit in GLSL ES but usually available in the vertex shader (refer to device documentation)
Precision Qualifiers

Precision depends on the operands:

```c
lowp float x;
mediump float y;
highp float z = x * y;
```
(evaluated at medium precision)

Literals do not have any defined precision

```c
lowp float x;
highp float z = x * 2.0 + 1.2;
```
(evaluated at low precision)
Constructors

Replaces type casting
No implicit conversion: must use constructors
All named types have constructors available
  Includes built-in types, structures
  Excludes arrays

Integer to Float:
  ```
  int n = 1;
  float x, y;
  x = float(n);
  y = float(2);
  ```
Constructors

Concatenation:

\[
\begin{align*}
\text{float } x &= 1.0, y = 2.0; \\
\text{vec2 } v &= \text{vec2}(x, y);
\end{align*}
\]

Structure initialization

\[
\begin{align*}
\text{struct } S &\{ \text{int } a; \text{ float } b; \}; \\
S &\text{ s} = S(2, 3.5);
\end{align*}
\]
Swizzle operators

Use to select a set of components from a vector
Can be used in L-values

```c
vec2 u, v;

v.x = 2.0; // Assignment to single component

float a = v.x; // Component selection

v.xy = u.yx; // swap components

v = v.xx; // replicate components

v.xx = u; // Error
```

Component sets: Use one of

xyzw OR rgba OR stpq
Indexing operator

Indexing operator

```cpp
vec4 u, v;
float x = u[0]; // equivalent to u.x
```

Must use indexing operator for matrices

```cpp
mat4 m
vec4 v = m[0];
m.x; // error
```
GLSL ES Overview

Operators

++   --   +   -   !   ()   []
*    /    +    -
<    <=    >    >=
==    !=
&&    ^^    ||
?:
=    *=    /=    +=    -=

Flow control

x == y ? a : b
if else
for while do
return break continue
discard (fragment shader only)
Built-in Variables

Aim of ES is to reduce the amount of fixed functionality
   Ideal would be a totally pure programmable model
   But still need some

Vertex shader
   \texttt{vec4 \ gl\_Position; \ // Write-only}
   \texttt{float \ gl\_PointSize; \ // Write-only}

Fragment shader
   \texttt{vec4 \ gl\_FragCoord; \ // Read-only}
   \texttt{bool \ gl\_FrontFacing; \ // Read-only}
   \texttt{vec2 \ gl\_PointCoord; \ // Read-only}
   \texttt{float \ gl\_FragColor; \ // Write only}
Built-in Functions

General
- pow, exp2, log2, sqrt, inversesqrt
- abs, sign, floor, ceil, fract, mod, min, max, clamp

Trig functions
- radians, degrees, sin, cos, tan, asin, acos, atan

Geometric
- length, distance, cross, dot, normalize, faceForward, reflect, refract
GLSL ES Overview

Interpolations

\[
\text{mix}(x, y, \alpha) = x \times (1.0 - \alpha) + y \times \alpha
\]

\[
\text{step}(\text{edge}, x) = \begin{cases} 
0.0 & \text{if } x \leq \text{edge} \\
1.0 & \text{otherwise}
\end{cases}
\]

\[
\text{smoothstep}(\text{edge0}, \text{edge1}, x) = \begin{cases} 
0.0 & \text{if } x \leq \text{edge0} \\
1.0 & \text{if } x \geq \text{edge1} \\
t & \text{otherwise}
\end{cases}
\]

\[
t = \frac{x - \text{edge0}}{\text{edge1} - \text{edge0}}
\]

\[
t = \text{clamp}(t, 0.0, 1.0)
\]

\[
\text{return } t \times t \times (3.0 - 2.0 \times t)
\]

Texture

\[
\text{texture1D}, \text{texture2D}, \text{texture3D}, \text{textureCube}
\]

\[
\text{texture1DProj}, \text{texture2DProj}, \text{textureCubeProj}
\]
GLSL ES Overview

Vector comparison ($\text{vecn}$, $\text{ivec}$)
- $\text{bvecn lessThan}(\text{vecn}, \text{vecn})$
- $\text{bvecn lessThanEqual}(\text{vecn}, \text{vecn})$
- $\text{bvecn greaterThan}(\text{vecn}, \text{vecn})$
- $\text{bvecn greaterThanEqual}(\text{vecn}, \text{vecn})$

Vector comparison ($\text{vecn}$, $\text{ivec}$, $\text{bvecn}$)
- $\text{bvecn equal}(\text{vecn}, \text{vecn})$
- $\text{bvecn notEqual}(\text{vecn}, \text{vecn})$

Vector ($\text{bvecn}$)
- $\text{bvecn any}(\text{bvecn})$
- $\text{bvecn all}(\text{bvecn})$
- $\text{bvecn not}(\text{bvecn})$

Matrix
- $\text{matrixCompMult (matn, matn)}$
Invariance

Robert J. Simpson
AMD
Invariance

Definition:

“An invariant operation is an operation that, given the same set of inputs, always produces the same result.”

So why might this not be true?
Invariance: The Problem

Causes of variance:

- Mathematical operations are not precisely defined.
- No IEEE arithmetic
- User has limited control over the driver/compiler
  - Compilers ‘cheat’ a bit to get better performance e.g.
    
    \[
    a + b + c + d \rightarrow (a+b) + (c+d)
    \]

    Mathematically correct but in floating point can give different a result

Consequence:

- Same code may produce (slightly) different results
Invariance

Why do you care?

Multi-pass

Any algorithm relying on repeatable calculations

Any algorithm relying on a value remaining constant
Consider a simple transform in the vertex shader:

\[
\begin{pmatrix}
    x' \\
    y' \\
    z' \\
    w'
\end{pmatrix} =
\begin{pmatrix}
    a & b & c & d \\
    e & f & g & h \\
    i & j & k & l \\
    m & n & o & p
\end{pmatrix}
\begin{pmatrix}
    x \\
    y \\
    z \\
    w
\end{pmatrix}
\]

\[
x' = ax + by + cz + dw
\]

But how is this calculated in practice?

There may be several possible code sequences.
Invariance

e.g.

\[
\begin{align*}
&\text{MUL R1, a, x} \\
&\text{MUL R2, b, y} \\
&\text{MUL R3, c, z} \\
&\text{MUL R4, d, w} \\
&\text{ADD R1, R1, R2} \\
&\text{ADD R3, R3, R4} \\
&\text{ADD R1, R1, R3}
\end{align*}
\]

or

\[
\begin{align*}
&\text{MUL R1, a, x} \\
&\text{MADD R1, b, y} \\
&\text{MADD R1, c, z} \\
&\text{MADD R1, d, w}
\end{align*}
\]
Invariance

Three reasons the result may differ:

- Use of different instructions
- Instructions executed in a different order
- Different precisions used for intermediate results (only minimum precisions are defined)

But it gets worse...
Modern compilers may rearrange your code
Values may lose precision when written to a register
Sometimes cheaper to recalculate a value
But will it be calculated the same way?

\[
\text{const vec2 pos} = a + b \times c; \quad // \text{Done once}
\]
\[
\text{// or twice?}
\]
\[
\text{vec4 col1} = \text{texture2D(tex1, pos)}; \quad // \text{does pos have}
\]
\[
\text{// the same value}
\]
\[
\text{// as before?}
\]
\[
\text{vec4 col2} = \text{texture2D(tex2, pos)}; \quad // \text{does pos have}
\]
\[
\text{// the same value}
\]
\[
\text{// as before?}
\]
\[
\text{gl\_FragColor} = \text{col1} - \text{col2}; \quad //
\]
Invariance

Solution is in two parts:
invariant keyword specifies that specific variables are invariant e.g.

```cpp
invariant varying vec3 LightPosition;
```

Currently can only be used on certain variables

Global switch to make all variable invariant

```cpp
#pragma STDGL invariant(all)
```
Invariance

Invariance flag controls:
Invariance within shaders
Invariance between shaders.

Usage
Turn on invariance to make programs ‘safe’ and easier to debug
Turn off invariance to get the maximum optimization from the compiler.
ES2.0 Example:
The Application Framework

Robert J. Simpson
AMD
Writing an application – Basic Steps

Set up EGL

Setup shader, pipeline state

Create vertex buffers, textures

Main loop
  Update state (transforms etc.)
  Bind
  Draw
Writing an App – Initialization

**EGL**
- Get EGL display
- EGL Initialization
- Choose EGL config options using an attribute list
- Create window surface
- Create EGL context and attach to surface

**GL ES**
- Compile and Link shaders
- Create and bind Textures
- Bind (or get) attributes
- Set up uniforms
- Create Vertex Buffers
- Map buffer data
Writing an App – EGL Initialization

EGLDisplay egl_display =
eglGetDisplay(EGL_DEFAULT_DISPLAY);

int ok = eglInitialize(egl_display,
&majorVersion,
&minorVersion)
EGL Initialization

Set up attributes for EGL context

    EGLint attr[MAX_EGL_ATTRIBUTES];

    attr[nAttrib++] = EGL_RED_SIZE;
    attr[nAttrib++] = 5;
    ...

    attrib[nAttrib++] = EGL_DEPTH_SIZE;
    attrib[nAttrib++] = 16;
    attrib[nAttrib++] = EGL_STENCIL_SIZE;
    attrib[nAttrib++] = 0;
    ...

EGL Initialization (cont)

eglChooseConfig(egl_display,
        attrib_list,
        &egl_config, // returned configs
        1, // max no. of configs
        &num_configs)

eglCreateWindowSurface(egl_display,
        egl_config,
        NativeWindowType (hWnd),
        NULL)
EGL Initialization: Creating a context

```c
context = eglCreateContext(egl_display,
                         egl_config,
                         EGL_NO_CONTEXT,
                         NULL);

eglMakeCurrent(egl_display,
               egl_surface,  // for draw
               egl_surface,  // for read
               egl_context);
```
Compiling and using shaders

Vertex Shader
- `glCreateShaderObject`
- `glShaderSource`
- `glCompileShader`
- `glDeleteObject`

Fragment Shader
- `glCreateShaderObject`
- `glShaderSource`
- `glCompileShader`
- `glDeleteObject`

- `glCreateProgramObject`
- `glAttachObject`
- `glLinkProgram`
- `glUseProgramObject`
- `glDeleteObject`
Compiling and Linking Shaders

Create objects

```c
program_handle = glCreateProgram();

// Create one shader of object of each type.

GLuint vertex_shader_handle
    = glCreateShader (GL_VERTEX_SHADER);

GLuint fragment_shader_handle
    = glCreateShader (GL_FRAGMENT_SHADER);
```
Compiling Shaders

Compile vertex shader (and fragment shader)

```c
char* vert_source = ...
const char* vert_gls[1] = {vert_source};
glShaderSource(vertex_shader_handle,
               1,                  // no. of strings
               vert_gls,
               NULL);

glCompileShader(vertex_shader_handle);
GLint vertCompilationResult = 0;
oglGetShaderiv(vertex_shader_handle,
               GL_COMPILE_STATUS,
               &vertCompilationResult);
```
Linking Shaders

Attach shaders to program object and link

```c
glAttachShader(program_handle,
              vertex_shader_handle);

glAttachShader(program_handle,
              fragment_shader_handle);

glLinkProgram (program_handle);
```

Note that many compilers will only report errors at link time.
Setting up Attributes

Can bind attributes before linking e.g.

```c
glBindAttribLocation (prog_handle, 0, "pos");
```

Or get attribute location after linking:

```c
GLint p;

p = glGetAttribLocation (prog_handle, "pos");
```

Can do a combination.
Setting up Textures

Texture samplers are **Uniforms** in GLSL ES

First Generate ID and specify type (cube map)

```cpp
uint32 Id;

glGenTextures(1, &Id);

glActiveTexture (GL_TEXTURE0);

glBindTexture(GL_TEXTURE_CUBE_MAP, Id);
```
glTexImage2D(GL_TEXTURE_CUBE_MAP_POSITIVE_X, 0, GL_RGBA, width, height, 0, GL_RGBA, GL_UNSIGNED_BYTE, image[0].pixels);

glTexImage2D(GL_TEXTURE_CUBE_MAP_NEGATIVE_X, ... glTexImage2D(GL_TEXTURE_CUBE_MAP_POSITIVE_Y, ... glTexImage2D(GL_TEXTURE_CUBE_MAP_NEGATIVE_Y, ... glTexImage2D(GL_TEXTURE_CUBE_MAP_POSITIVE_Z, ... glTexImage2D(GL_TEXTURE_CUBE_MAP_NEGATIVE_Z, ...
Setting up Uniforms

Must do this after glUseProgram:

```c
glUseProgram(prog_handle);
```

Use glGetUniformLocation e.g.

```c
GLint loc_sky_box =
    glGetUniformLocation (prog_handle,"skyBox");
```

Can then set value e.g.

```c
GLint texture_unit = 0;
glUniform1i (loc_sky_box,texture_unit);
```
Setting up Attribute Buffers

Create buffer names

```c
GLuint bufs[1];

glGenBuffers (1, bufs);
```

Create and initialize buffer

```c
glBindBuffer (GL_ARRAY_BUFFER, bufs[0]);

glBufferData (GL_ARRAY_BUFFER,
            size_bytes, p_data, GL_STATIC_DRAW);
```
Setting up Attribute Buffers (cont)

Specify format:

```c
glBindBuffer(GL_ARRAY_BUFFER, bufs[0]);

glVertexAttribPointer(0, // index
                    4, // size
                    GL_FLOAT, // type
                    GL_FALSE, // normalize?
                    0, // (stride)
                    NULL ); // (attribs)
```
Drawing the frame

Clear frame buffer
Set render state
Enable array
DrawArray
Enable array and Draw

```c
glEnableVertexAttribArray( 0 );

glBindBuffer (GL_ARRAY_BUFFER,0);

glDrawArrays (GL_TRIANGLE_STRIP,0, n_vertices);
```
ES2.0 Example
- The shaders
Example: Water demo
Skybox

Geometry is a sphere
Use position to access a cube map
Cube Map
Skybox

Access cube map using the normals of the vertices
Skybox

But...

Normal = Position

So no need to generate and store separate normals
uniform mat4 view_proj_matrix;
uniform vec4 view_position;
attribute vec4 rm_Vertex;
varying vec3 vTexCoord;
void main(void)
{
    vec4 newPos = vec4(1.0);
    newPos.xyz = rm_Vertex.xyz + view_position.xyz;
    gl_Position = view_proj_matrix * vec4(newPos.xyz,1.0);
    vTexCoord = rm_Vertex.xyz;
}
Sky box: Fragment Shader

precision highp float;
uniform samplerCube skyBox;
varying vec3 vTexCoord;
void main(void)
{
    gl_FragColor = textureCube(skyBox,vTexCoord);
}
Water: Reflection Mapping

- Perturbed normal
- Original normal
- Actual geometry
- Geometry we are trying to emulate
Approximating Fresnel Reflection

Greater angle of incidence = less reflection

Smaller angle of incidence = more reflection
Fresnel Reflection (cont.)

- Less reflection
- Perturbed normal, High angle of incidence
- More reflection
- Unperturbed normal, Low angle of incidence
- View vector
Water

Geometry is a simple grid
Uses the same cubemap as the skybox
Water Ripples

Use noise texture for bump map.

Exact texture not important

Try experimenting
Water: Vertex Shader

uniform vec4 view_position;
uniform vec4 scale;
uniform mat4 view_proj_matrix;
attribute vec4 rm_Vertex;
attribute vec3 rm_Normal;
varying vec2 vTexCoord;
varying vec3 vNormal;
varying vec3 view_vec;
void main(void)
{
    vec4 Position = rm_Vertex.xyzw;
    Position.xz *= 1000.0;
    vTexCoord    = Position.xz * scale.xz;
    view_vec     = Position.xyz - view_position.xyz;
    vNormal      = rm_Normal;
    gl_Position  = view_proj_matrix * Position;
}
uniform sampler2D noise;
uniform samplerCube skyBox;
uniform float time_0_X;
uniform vec4 waterColor;
uniform float fadeExp;
uniform float fadeBias;
uniform vec4 scale;
uniform float waveSpeed;
varying vec2 vTexCoord;
varying vec3 vNormal;
varying vec3 vViewVec;
void main( void )
{
    vec2 tcoord = vTexCoord;
    tcoord.x += waveSpeed * time_0_X;
    vec4 noisy = texture2D(noise, tcoord.xy);
    // Signed noise
    vec3 bump = 2.0 * noisy.xyz - 1.0;
    bump.xy *= 0.15;

    // Make sure the normal always points upwards
    bump.z = 0.8 * abs(bump.z) + 0.2;
Water Fragment Shader (cont)

// Offset the surface normal with the bump
bump = normalize(vNormal + bump);

// Find the reflection vector
vec3 reflVec = reflect(vViewVec, bump);
vec4 refl = textureCube(skyBox, reflVec.yzx);
Water Fragment Shader (cont)

float lrp = 1.0 - dot(-normalize(vViewVec), bump);

// Interpolate between the water color and
// reflection
float blend = fadeBias + pow(lrp, fadeExp);
blend = clamp(blend, 0.0, 1.0);
gl_FragColor = mix(waterColor, refl, blend);
}
Programming Tips
Programming Tips

Check for errors regularly

Use e.g.

```c
assert(!glError ());
```

But remember `glError()` gets the last error:

```c
... // error here
Glint error = glError ();
...
assert(!glError ()); // No error
```
The coordinate system

Coordinate system is:

Right handed before projection
  Increasing z is towards the viewer.

Left handed after projection
  Increasing z is away from the viewer.
Matrix Convention

Matrices are column-major
   column index varies more slowly
Vectors are columns
But this is purely convention
Only the position in memory is important
   Translation specified in elements 12,13,14
The projection matrix

You need to provide a projection matrix e.g.

\[
\begin{bmatrix}
\frac{2.0\times \text{near}}{\text{right} - \text{left}} & 0.0 & \frac{\text{right} + \text{left}}{\text{top} + \text{bottom}} & 0.0 \\
0.0 & \frac{2.0\times \text{near}}{\text{top} - \text{bottom}} & 0.0 & 0.0 \\
0.0 & 0.0 & \frac{-(\text{far} + \text{near})}{\text{far} - \text{near}} & -2.0\times \frac{\text{far}\times \text{near}}{\text{far} - \text{near}} \\
0.0 & 0.0 & -1.0 & 0.0
\end{bmatrix}
\]

near and far are both positive
Performance Tips

Keep fragment shaders simple
- Fragment shader hardware is expensive.
- Early implementations will not have good performance with complex shaders.

Try to avoid using textures for function lookups.
- Calculation is quite cheap, accessing textures is expensive.
- This is more important with embedded devices.
Performance Tips (cont)

Minimize register usage
Embedded devices do not support the same number of registers compared with desktop devices. Spilling registers to memory is expensive.

Minimize the number of shader changes
Shaders contain a lot of state
May require the pipeline to be flushed
Use uniforms to change behaviour in preference to loading a new shader.
ES vs. Desktop
GLSL ES vs. GLSL desktop

Based on GLSL as used in OpenGL 2.0
  Open standard
Pure programmable model
  Most fixed functionality removed.
Not 100% backward compatible with ES1.x
  Embedded systems do not have the legacy requirements of the desktop
No Software Fallback
  Implementations (usually) hardware or nothing
  Running graphics routines in software doesn’t make sense on embedded platforms
Optimized for use in Embedded devices
  Aim is to reduce silicon cost
  Reduced shader program sizes
  Reduced register usage
  Reduced numeric precision
Mobile Architecture

CPU, graphics on the same chip.
Unified memory architecture
Cache for CPU
Only limited cache for graphics device
No internal framebuffer
No internal z buffer
Limited texture cache
Mobile vs. PC Architecture

Mobile

- SOC
- CPU
- GPU
- BUS
- Memory

PC

- CPU
- GPU
- Chipset
- Memory
Mobile Architecture – What this means

Limited memory bandwidth
- Hardware number crunching is relatively cheap
- Moving data around is the main problem
- Frame buffer access (or geometry buffer access for tiled architectures) is a heavy user
- Texture bandwidth is an issue

CPU cannot perform floating point
- Rather different from the PC world
- Means more rapid move to hardware vertex shaders

Any advantages?
- Lower resolution means less data to move around
- Easier to access frame/depth buffer because of unified memory
Performance Tips
Tips for Improving Performance

Golden rules:

- Don’t do things you don’t need to do
- Let the hardware do as much as possible
- Don’t interrupt the pipeline
- Minimize data transfer to and from the GPU
Don’t do what you don’t need to do

What frame rate do you actually need?

  Achieving 100fps on a PC may be a good thing
  LCD displays have slower response
  Eats power.

Not using depth testing? Turn off the z buffer

  Saves at least one read per pixel

Not using alpha blending? Turn it off.

  Saves reading the colour buffer.

Not using textures? Don’t send texture coordinates to the GPU

  Reduces geometry bandwidth
Let the hardware do it

Hardware is very good at doing computation

- Transform and lighting is fast
- Will become even more useful with vertex shaders
- Texture blending is ‘free’. Don’t use multi-pass.
- Anti-aliasing is very cheap.
- Hardware is good when streaming data
  - But works best when data is aligned with memory
  - Most efficient when large blocks are transferred
- BUT: Memory bandwidth is still in short supply
Minimize Data Transfer

Use Vertex Buffers

- Driver can optimize storage (alignment, format)

Reduce Vertex Size

- Use byte coordinates e.g. for normals

Reduce size of textures

- Textures cached but limited on-chip memory
- Use mip-mapping. Better quality and lower data transfer
- Use texture compression where available.
Memory Alignment

Always best to align data
  Alignment to bus width very important
  Alignment to DRAM pages gives some benefit

Embedded devices have different types of memory
  Bus width may be 32 bit, 64 bit or 128 bit

Penalty for crossing a DRAM page (typically 1-4KB)
  Can be several cycles.
Batch Data

Why?

Big overhead for interpreting the command and setting up a new transfer

Memory latency large

How?

Combine geometry into large arrays.

Use Vertex Buffer Objects
Batch Data

Don’t:

Vertices → GPU

- Multiple API calls
- Lots of overhead
- Slow

Do:

Vertices → GPU

- Fewer API calls
- Less overhead
- Much faster
Vertex Buffer Objects

Even better:

Step 1: Create
Client Side
Vertices

Server Side
VBO

Step 2: Draw
VBO

Driver can optimize storage

GPU
Vertex Buffer Objects

Ultimately:

Vertices → VBO → Local Memory → GPU → Draw
Don’t interrupt the pipeline

GPUs are streaming architectures. They have high bandwidth but also long latencies.

Minimize state changes.
  Set up state and then render as much as possible.
  E.g. Don’t mix 2d and 3d operations

Don’t lock buffers unnecessarily
  OK at end of scene

Don’t use GetState unnecessarily
  Main usage is for 3rd party libraries. App should know what the state is.

All these can cause interruptions to data streaming.
  May even cause the entire pipeline to be flushed.
More on State Changes

Major changes of state will always be expensive

- Changing textures (consider using a texture atlas)
- Texture environment modes
- Light types (e.g. turning on specular)

Some are quite cheap

- Turning individual lights on and off
- Enabling/disabling depth buffer

BUT

- Varies with the hardware (and driver) implementation
Be nice to the Vertex Cache

Hardware typically holds 8-32 vertices.

- Smaller than in software implementations
- Likely to vary between implementations
- Possible to trade no. of vertices against vertex size in some implementations

Hardware cannot detect when two vertices are the same.

To make efficient use of the cache use:

- Vertex Strips
- Vertex fans
- Indexed triangles
Vertex Cache

Individual triangles: 3 vertices/triangle

Vertex Strip: 1 vertex triangle (ideal case)

Indexed triangles: 0.5 vertices/triangle (ideal case)
Depth Complexity

Drawing hidden triangles is expensive.

Costs:
- Transferring the geometry
- Transform & lighting
- Fetching texels for hidden pixels
- Reading and writing the colour and depth buffer
- Storing and reading the geometry (tiled or delay stream architectures)

Deferred rendering is not a magic solution
- Can even make matters worse in some situations
Depth Complexity - solutions

Render scene front to back

- Eliminates many writes to colour and depth buffer
- Can reduce texture fetches (early z kill)

Use standard occlusion culling techniques

- View frustum culling (don’t draw objects that are out of view)
- DPVS
- Portals
Future Trends
Future Trends

More local caches for graphics hardware
Display resolution increasing
  More pixel pipelines
Better power management
Integration of other functionality
  Video
Questions?
M3G Intro

Kari Pulli
Nokia Research Center
Mobile 3D Graphics APIs

Native C/C++ Applications

Java applications

M3G (JSR-184)

OpenGL ES

Graphics Hardware
Why Should You Use Java?

Largest and fastest growing installed base
1600M phones running Java by end of 2007
814M in 2007 alone
The majority of phones sold today support Java

Better productivity compared to C/C++
Much fewer opportunities to introduce bugs
Comprehensive, standardized class libraries
Java Will Remain Slower

Benchmarked on an ARM926EJ-S processor with hand-optimized Java and assembly code.
M3G Design Principles

#1 No Java code along critical paths

Move all graphics processing to native code
Not only rasterization and transformations
Also morphing, skinning, and keyframe animation
All data on native side to avoid Java-native traffic
M3G Design Principles

#2 Cater for both software and hardware

Do not mandate hardware-only features
Such as per-pixel mipmapping or per-pixel fog

Do not try to expand the OpenGL pipeline
Such as with hardcoded transparency shaders
M3G Design Principles

#3 Maximize developer productivity

Address content creation and tool chain issues

- Export art assets into a compressed file (.m3g)
- Load and manipulate the content at run time
- Need scene graph and animation support for that

Minimize the amount of “boilerplate code”
M3G Design Principles

#4 Minimize engine complexity

#5 Minimize fragmentation

#6 Plan for future expansion
Why a New Standard?

OpenGL ES is too low-level
- Lots of Java code and function calls needed
- Data passed frequently from Java -> native -> driver
- No support for animation and scene management

Java 3D is too bloated
- A hundred times larger (!) than M3G
- Still lacks a file format, skinning, etc.
M3G API Overview

Tomi Aarnio
Nokia Research Center
Objectives

Get an idea of the API structure and features
Learn practical tricks not found in the spec
Prerequisites

Fundamentals of 3D graphics
Some knowledge of OpenGL ES
Some knowledge of scene graphs
M3G API Overview

Getting started
Rendering
Scene graph
Performance tips
Deformable meshes
Keyframe animation
Demos
Programming Model

M3G is not an “extensible scene graph”

Rather a black box – much like OpenGL

No interfaces, events, or render callbacks

No threads; all methods return only when done
Programming Model

Scene update is decoupled from rendering

- **render** ➔ Draw the scene, no side-effects
- **animate** ➔ Update the scene to the given time
- **align** ➔ Re-orient target cameras, billboards
Key Classes

Graphics3D
- 3D graphics context
  - Performs all rendering

Loader
- Loads individual objects and entire scene graphs

Mesh
- Encapsulates triangles, vertices and appearance

World
- Scene graph root node
Graphics3D: How to Use

Bind a target to it, render, release the target

```java
void paint(Graphics g) {
    myGraphics3D.bindTarget(g);
    myGraphics3D.render(world);
    myGraphics3D.releaseTarget();
}
```
Rendering State

Graphics3D contains global state
- Frame buffer, depth buffer
- Viewport, depth range

Most rendering state is in the scene graph
- Vertex buffers, textures, matrices, materials, …
- Packaged into Java objects, referenced by meshes
- Minimizes Java-native data traffic, enables caching
M3G API Overview

Getting started

Scene graph

Performance tips

Deformable meshes

Keyframe animation

Demos
Renderable Objects

- **Sprite3D**: 2D image placed in 3D space. Always facing the camera.
- **Mesh**: Made of triangles. Base class for meshes.
Sprite3D

2D image with a position in 3D space

- Scaled mode for billboards, trees, etc.
- Unscaled mode for text labels, icons, etc.
- Too much overhead for particle effects
Mesh

One VertexBuffer, containing VertexArrays
1..N submeshes (IndexBuffer + Appearance)

* M3G supports RGB color arrays, although OpenGL ES only supports RGBA.
Vertex and Index Buffer Objects

- Vertices and indices are stored on server side
- Similar to OpenGL Buffer Objects
  - Reduces data traffic from Java to native
  - Allows caching, bounding box computation, etc.
Appearance Components

- **Material**: Material colors for lighting, can track per-vertex colors
- **CompositingMode**: Blending, depth buffering, alpha testing, color masking
- **PolygonMode**: Winding, culling, shading, perspective correction hint
- **Fog**: Fades colors based on distance, linear and exponential mode
- **Texture2D**: Texture matrix, blending, filtering, one Texture2D for each unit
Fragment (Pixel) Pipeline

1. **Texture Blend**
   - Output to **Texel Fetch**
   - Input from **Texture Blend**

2. **Texel Fetch**
   - Input from **Texture Blend**
   - Output to **Depth Buffer**
   - Input from **Frame Buffer**

3. **Depth Buffer**
   - Input from **Texel Fetch**
   - Output to **Depth Test**
   - Input from **Alpha Test**

4. **Alpha Test**
   - Input from **Texel Fetch**
   - Output to **Depth Test**

5. **Depth Test**
   - Input from **Alpha Test**
   - Output to **Blend & Mask**

6. **Blend & Mask**

```

Not allowed!
Shared Node Components

World

Mesh
Camera
SkinnedMesh
Mesh

Appearance

Texture2D

Appearance
Node Transformation

From this node to the parent node

Composed of four parts

- Translation $T$
- Orientation $R$
- Non-uniform scale $S$
- Generic 3x4 matrix $M$

$C = T \cdot R \cdot S \cdot M$
Node Alignment

Reorients a node towards a target node
Recomputes the orientation component (R)

For target cameras & lights, billboards, etc.
Other Node Features

Inherited properties

- Alpha factor (for fading in/out)
- Rendering enable (on/off)
- Picking enable (on/off)

Scope mask
Content Production

- DCC tool
- Exporter
- Intermediate Format (e.g. COLLADA)
- Optimizer & Converter
- M3G Loader
- Delivery Formats (.m3g, .png)

Runtime Scene Graph
M3G File Format

- Small size, easy to decode
- Matches API features 1:1
- Stores individual objects, entire scenes
- ZLIB compression of selected sections
- Can reference external files – e.g. textures
- Highly portable – no extensions
M3G API Overview

Getting started
Rendering
Scene graph
Performance tips
Deformable meshes
Keyframe animation
Demos
Use the Retained Mode

Render a World instead of separate objects
Minimizes Java code and method calls
Allows view frustum culling, etc.

Put co-located objects into Groups
Speeds up hierarchic view frustum culling
Simplify Node Properties

Transformations

- Favor the $T \ R \ S$ components over $M$
- Avoid non-uniform scales in $S$
- Use auto-alignment sparingly

Keep the alpha factor at 1.0
Optimize Rendering Order

`Appearance.setLayer(int layer)`

Defines a global ordering for submeshes
Within each layer, opaque objects come first

Use layers for…

Making sure that overlays are drawn first
Making sure that distant objects are drawn last
Multipass effects (e.g. for lighting)
Optimize Texturing

Multitexturing is faster than multipass
Transformation and setup costs cut by half

Use mipmaps to save memory bandwidth
Tradeoff: 33% extra memory consumption

Combine small textures into a texture atlas
Use Perspective Correction

Much faster than increasing triangle count

Nokia: 2% fixed overhead, 20% in the worst case
No overhead at all on hardware implementations

Pitfall: Quality varies by implementation

Refer to quality scores at www.jbenchmark.com
Reduce Object Count

Per-Mesh processing overhead is high
Per-submesh overhead is also fairly high

Merge

Meshes that are close to each other
submeshes that have a common Appearance
Avoid Dynamic Geometry

`VertexArray.set(...)` can be slow

Java array contents must be copied in
May also trigger bounding box updates, etc.
Replace with morphing or skinning where possible

`IndexBuffers` have no `set(...)` method at all

`new IndexBuffer(...) per frame is not` a good idea
Switch between predefined `IndexBuffers` instead
Beware of Exporters

Exported content is often suboptimal

- Lighting enabled, but overwritten by texture
- Lighting disabled, normal vectors still included
- Alpha blending enabled, but alpha always 1.0
- 16-bit vertices when 8 bits would be enough
- Perspective correction always enabled

…

Always review the exported scene tree!
Hardware vs. Software

Shading state

SW: Minimize per-pixel operations
HW: Minimize shading state changes

Mixing 2D and 3D rendering

SW: No performance penalty
HW: Substantial penalty (up to 3x)
Layering 2D and 3D

2D backdrop
3D background
2D spectators
3D field
2D players
2D overlays

~7 layers of 2D and 3D!

Playman Beach Volley © RealNetworks, Inc.
Use Picking with Caution

myWorld.pick(...) can be very slow

Restrict the pick ray to
- meshes in a specific Group
- meshes with a specific scope mask

Use simplified geometry for picking
- setPickingEnable(true)
- setRenderingEnable(false)
Particle Effects

Point sprites – not available
Sprite3D – much too slow

Put all particles in one Mesh
One particle == two triangles
Animate by `VertexArray.set(...)`
Easy Terrain Rendering

Split the terrain into tiles (Meshes)
Put the meshes into a scene graph
The engine will do view frustum culling
Terrain Rendering with LOD

Preprocess into a quadtree

leaf node == Mesh
inner node == Group

Use `setRenderingEnable` based on the view frustum

Demos
Deforming Meshes

- MorphingMesh
  - Vertex morphing mesh

- SkinnedMesh
  - Skeletally animated mesh
MorphingMesh

Traditional vertex morphing animation

Can morph any vertex attribute(s)

A base mesh $\mathbf{B}$ and any number of morph targets $\mathbf{T}_i$

Result = weighted sum of morph deltas

$$\mathbf{R} = \mathbf{B} + \sum_{i} w_i (\mathbf{T}_i - \mathbf{B})$$

Change the weights $w_i$ to animate
MorphingMesh

- Base
- Target 1: eyes closed
- Target 2: mouth closed
- Animate eyes and mouth independently
SkinnedMesh

Articulated characters without cracks at joints

Stretch a mesh over a hierarchic “skeleton”

The skeleton consists of scene graph nodes

Each node (“bone”) defines a transformation

Each vertex is linked to one or more bones

\[ v' = \sum_i w_i M_i B_i v \]

\( M_i \) are the node transforms – \( v, w, B \) are constant
SkinnedMesh

Neutral pose, bones at rest

shared vertex, weights = (0.5, 0.5)

"skin"

non-shared vertex

Bone A

Bone B
SkinnedMesh

Bone B rotated 90 degrees

position in A's coordinate system

interpolated position

position in B's coordinate system
SkinnedMesh

Animation Classes

- **KeyframeSequence**: Storage for keyframes. Defines interpolation, looping.
- **AnimationController**: Controls the playback of one or more sequences.
- **AnimationTrack**: A link between sequence, controller and target.
- **Object3D**: Base class for all objects that can be animated.
Animation Classes

Object3D

AnimationTrack

AnimationController

KeyframeSequence

Identifies animated property on this object
KeyframeSequence: Interpolation Modes

...plus SLERP and SQUAD for quaternions
AnimationController: Timing and Speed

Maps world time into sequence time
Can control any number of sequences

Diagram courtesy of Sean Ellis, ARM
Animation

1. Call animate(worldTime)

2. Calculate sequence time from world time

3. Look up value at this sequence time

4. Apply value to animated property

Diagram courtesy of Sean Ellis, ARM
Animation

**Tip:** Interpolate quaternions as ordinary 4-vectors

- Supported in HI Corp’s M3G Exporter
- SLERP and SQUAD are slower, but need less keyframes
- Quaternions are automatically normalized before use

Playman World Soccer – RealNetworks

2D/3D hybrid
Cartoon-like
2D figures in a 3D scene
2D particle effects etc.
Tower Bloxx – Digital Chocolate

- Puzzle/arcade mixture
- Tower building mode is in 3D, with 2D overlays and backgrounds
- City building mode is in pure 2D
Mini Golf Castles – Digital Chocolate

- 3D with 2D background and overlays
- Skinned characters
- Realistic ball physics
Rollercoaster Rush – Digital Chocolate

2D backgrounds
3D main scene
2D overlays

Tips for Designers 1

TIP: Don’t use GIF files
The specification does not require their support

TIP: Create the best possible quality audio & music
It’s much easier to reduce the quality later than increase it

TIP: Polygon reduction tools & polygon counters are your friends
Use the minimum number of polygons that conveys your vision satisfactorily
Tips for Designers 2

**TIP: Use light maps for lighting effects**
- Usually faster than per-vertex lighting
- Use luminance textures, not RGB
- Multitexturing is your friend

**TIP: Try LINEAR interpolation for Quaternions**
- Faster than SLERP
- But less smooth
Tips for Designers 3

**TIP: Favor textured quads over Background & Sprite3D**

Background and Sprite3D will be deprecated in M3G 2.0

Were intended to speed up software renderers

but implementation is complex, so not much speed up and no speed up at all with hardware renderers

Nevertheless Sprite3Ds are convenient to use for 2D overlays and Backgrounds are convenient when background scrolling is required.

**LIMITATION: Sprites not useful for particle systems**

The structure of a MIDlet

• A walk through a sample game
• Why mobile game development is hard
• Publishing your content
The Simplest MIDlet

Derived from MIDlet,
Overrides three methods

\[
\begin{align*}
\text{MIDlet.StartApp()} & \quad \text{[initialize]} \\
& \quad \text{[request redraw]} \\
\rightarrow & \quad \text{MIDlet.destroyApp()} \\
& \quad \text{[shut down]} \\
\end{align*}
\]

\[\text{Canvas.paint()}\]
performs rendering using Graphics3D object.

Create canvas; load world.

And that’s it.
A More Interesting MIDlet

```
MIDlet.StartApp()
Create canvas; load world, start update thread
```

```
initialize
```

```
user input
Get any user input via Canvas.commandListener
```

```
scene update
Game logic, animate, align if necessary
```

```
request redraw
```

```
wait
Wait to ensure consistent frame rate
```

```
draw
Canvas.paint()
performs rendering using Graphics3D object
```

```
MIDlet.destroyApp()
T i d y u p ;
exit MIDlet
```

Update loop.
Runnable.run()
Read user input, update scene

Exit request

Flow-chart courtesy of Sean Ellis, ARM
MIDlet Phases

- Initialize
- Update
- Draw
- Shutdown
Initialize

Load assets: world, other 3D objects, sounds, etc.
Find any objects that are frequently used
Perform game logic initialization
Initialize display
Initialize timers to drive main update loop
Update

Usually a thread driven by timer events
Get user input
Get current time
Run game logic based on user input
Game logic updates world objects, if necessary
Animate
Request redraw
Update Tips

**TIP:** Don’t create or release objects if possible

**TIP:** Call `system.gc()` regularly to avoid long pauses

**TIP:** Cache any value that does not change every frame; compute only what is absolutely necessary
Draw

- Usually on overridden paint method
- Bind Graphics3D to screen
- Render 3D world or objects
- Release Graphics3D
  - ...whatever happens!
- Perform any other drawing (UI, score, etc)
- Request next timed update
Draw Tips

TIP: Don’t do 2D drawing while Graphics3D is bound
Shutdown

Tidy up all unused objects

Ensure once again that Graphics3D is released

Exit cleanly

Graphics3D should also be released during pauseApp
MIDlet Review

Update loop.
Don’t create/destroy objects if possible
Throttle to consistent frame rate
Keep paint() as simple as possible
Be careful with threads

Exit request

Set up display, load assets, find commonly used objects, initiate update thread.

Get any user input, network play, etc.

Game logic, animate, align if necessary

Wait to ensure consistent frame rate

Release assets, tidy up

Graphics3D object performs rendering

Demo: GhostHunt
**GhostHunt**

Arrow keys move a “plasma” racquet side to side to hit a “plasma” ball

Ball hits deform ghost houses and make the ghosts disappear

Loads data from .m3g and .png files

Uses Immediate mode

Uses 2D for sky and scores
GhostHunt Models
GhostHunt Framework

MainApp.java – MIDlet specialization; handles initialization & data loading; contains run thread

SubApp.java – canvas specialization

Math2.java – math library
import javax.microedition.midlet.*;
import javax.microedition.lcdui.*;
import javax.microedition.m3g.*;

class MainApp extends MIDlet implements CommandListener {
    MainApp() {
        exit_command = new Command("Exit", Command.EXIT, 0);
        select_command = new Command("Debug", Command.SCREEN, 0);

        /* Create canvas */
        subapp = new SubApp();
        subapp.addCommand(exit_command);
        subapp.addCommand(select_command);
        subapp.setCommandListener(this);

        SystemInit();
        prog_number = PROG_SPLASH;
        WorkInit();
        GameInit();
        DataLoad();
    }
}
GhostHunt: loading data

```java
DataLoad() {
    try {
        image [TITLE_SP] = Image.createImage("/title.png");
        ...
    } catch (Exception e) {
        System.out.println("------------- SP Load");
        ApplicationEnd();
    }

    try {
        load_data [RACKET_DATA] = Loader.load("/racket.m3g");
    } catch (Exception e) {
        ...
    }

    mesh [RACKET_DATA] = (Mesh)load_data [RACKET_DATA][0];
    vbuf [RACKET_DATA] = mesh [RACKET_DATA].getVertexBuffer();
    ibuf [RACKET_DATA] = mesh [RACKET_DATA].getIndexBuffer(0);
    app [RACKET_DATA] = mesh [RACKET_DATA].getAppearance(0);
    ...
}
```
public void startApp () {
    thread = new Thread () {
        public void run () {
            GameStart ();
        }
    };
    // Call the new thread’s run method.
    thread.start ();
}

public void pauseApp () {
    thread = null;
}

public void destroyApp (boolean unconditional) {
    ApplicationEnd();
}
void GameStart () {
    Thread thisThread = Thread.currentThread();
    Display.getDisplay (this).setCurrent (subapp);
    while (thread == thisThread) {
        prev_time = now_time;
        do {
            now_time = System.currentTimeMillis ();
        } while ((now_time - prev_time) < SYSTEM_SPEED);
        loop_rate = (now_time - prev_time) / SYSTEM_SPEED;
        if (loop_rate > 5.0f) { /* More than loop rate limit */
            loop_rate = 5.0f;
        }
        /* do game stuff here ... */
        try {
            Thread.sleep (1);
        } catch (InterruptedException e) {
            ApplicationEnd ();
        }
    }
}

    MainApp.g3d.bindTarget (graphics);
    MainApp.g3d.clear (MainApp.background);

    /*------ camera setup ------*/
    ...

    /*------ draw 3D objects ------*/
    ...

    MainApp.g3d.releaseTarget ();

    /*------ draw score, items etc. in 2D ------*/
    ...
}
**GameDraw: camera set-up**

```java
MainApp.ctrans.setIdentity();
MainApp.ctrans.postTranslate( MainApp.camera_tx, 
                        MainApp.camera_ty, 
                        MainApp.camera_tz );

MainApp.ctrans.postRotate( MainApp.camera_ry, 
                        0.0f, 1.0f, 0.0f );

MainApp.ctrans.postRotate( MainApp.camera_rx, 
                        1.0f, 0.0f, 0.0f );

MainApp.ctrans.postRotate( MainApp.camera_rz, 
                        0.0f, 0.0f, 1.0f );

MainApp.g3d.setCamera( MainApp.camera, MainApp.ctrans );
```
GameDraw: draw 3d objects

for (count = 0; count != MainApp.GHOST_MAX; count++)
{
    if (MainApp.ghost_draw_flag [count] != 0) {
        data = count * 2;
        x = MainApp.ghost_xz [data + 0];
        z = MainApp.ghost_xz [data + 1];
        r = MainApp.ghost_r [count];
        trans = MainApp.trans[MainApp.GHOST_M + count];
        trans.setIdentity ();
        trans.postTranslate (x, 0.0f, z);
        trans.postRotate (r, 0.0f, 1.0f, 0.0f);
        trans.postScale (MainApp.ghost_scale [count],
                         MainApp.ghost_scale [count],
                         MainApp.ghost_scale [count]);
        MainApp.g3d.render (MainApp.vbuf [MainApp.GHOST_DATA],
                            MainApp.ibuf [MainApp.GHOST_DATA],
                            MainApp.app [MainApp.GHOST_DATA],
                            trans);
    }
}
void GameProg() {
    key_dat_old = key_dat; /*---- Get key data ----*/
    key_dat = subapp.sys_key;

    CameraWorldSet ();
    if (Math2.DistanceCalc2D (0.0f, 0.0f, ball_tx, ball_tz) > 1.5f) {
        CameraSet (15.0f * (1.0f / loop_rate));
    }

    if (freeze_time == 0) /* The Game is not frozen */ {
        /*------- do game calculations ------*/

        ...
    }
    EffectProg ();
    subapp.repaint ();
    ...
}
**GameProg:** do game calculations

```c
RacketProg (key_dat, key_dat_old); /*--- Plasma Racket ---*/

if (racket_break_flag != 1) /*-- Racket not destroyed --*/
    BallProg ();

GhostProg ();

if (racket_break_flag != 1) /*-- Racket not destroyed --*/ {
    BallHit (); /*--- Collision Decision ---*/
    RacketBreakCheck ();
}

house = HouseCheck (); /*------ Final Check ------*/
if (house == 0) /* All ghost houses are destroyed. */ {
    /*------ make all remaining ghosts disappear ------*/
    ...
    freeze_time = (int)(MOJI_CLEAR_WAIT * (1.0f/loop_rate));
    moji_number = MOJI_CLEAR;
}
```
BallProg: compute new ball position

```c
void BallProg () {
    ...
    ball_speed_rate = ball_speed * loop_rate;

    dis = Math2.DistanceCalc2D(ball_tx, ball_tz, 0.0f, 0.0f);
    pd = Math2.DistanceCalc2D(ball_tx2, ball_tz2, 0.0f, 0.0f);
    if ((dis > 2.0f) && pd > dis)) /* Homing is necessary */ {  
        angle = Math2.AngleCalc (ball_tx, ball_tz, 0.0f, 0.0f);
        if (Math2.DiffAngleCalc (angle, ball_vec) > 0.0f) {
            ball_vec -= (0.6f * loop_rate);
        } else {
            ball_vec += (0.6f * loop_rate);
        }
    }
    Math2.RotatePointCalc (ball_speed_rate, ball_vec);
    ball_tx2 = ball_tx; /* Save the previous coordinates */
    ball_tz2 = ball_tz;
    ball_tx += Math2.calc_x;
    ball_tz += Math2.calc_y;
}
```
void BallHit () {
    ...
    /*------ racket collision detection ------*/
    ...
    /*------ ghost house collision detection ------*/
    ...
    /*------ ghost collision detection ------*/
    ...
    /*------ obstacle (cross) collision detection ------*/
    ...
    /*------ warp hole collision detection ------*/
    ...
    /*------ check for outside the field ------*/
    ...
}
BallHit: racket collision detection

```java
void BallHit () {
    ... /* final static int Math2.ANGLE = 360 */
    dist = Math2.DistanceCalc2D (racket_tx, racket_tz
                                ball_tx, ball_tz);

    if (dist <= BALL_RACKET_DISTANCE) {
        angle = Math2.AngleCalc (ball_tx, ball_tz, racket_tx,
                                  racket_tz);
        diff  = Math2.DiffAngleCalc(angle, ball_vec
                                      + (Math2.ANGLE/2.0f));

        if (Math2.Absf (diff) > (Math2.ANGLE / 4.0f)) {
            /* Feasible angle for collision */
            ball_vec = angle + (diff * -1.0f);

            Math2.RotatePointCalc (ball_speed_rate, ball_vec);
            ball_tx  = ball_tx2 + Math2.calc_x;
            ball_tz  = ball_tz2 + Math2.calc_y;
        }
    }
    ...}
```
Room for improvement?
Improvement 1: simpler drawing

```c
for (count = 0; count != MainApp.GHOST_MAX; count++)
{
    if (MainApp.ghost_draw_flag [count] != 0) {
        ...
        MainApp.g3d.render (MainApp.vbuf [MainApp.GHOST_DATA],
                            MainApp.ibuf [MainApp.GHOST_DATA],
                            MainApp.app [MainApp.GHOST_DATA],
                            trans);
        MainApp.g3d.render (MainApp.mesh [MainApp.GHOST_DATA],
                            trans)
    }
}
```
Improvement 2: no busy waiting

```java
while (thread == thisThread) {
    prev_time = now_time;
    do {
        now_time = System.currentTimeMillis();
    } while ((now_time - prev_time) < SYSTEM_SPEED);
    loop_rate = (now_time - prev_time) / SYSTEM_SPEED;
    if (loop_rate > 5.0f) { /* More than loop rate limit */
        loop_rate = 5.0f;
    }
    /* do game stuff here ... */
    try {
        Thread.sleep (1);
    } catch (InterruptedException e) {
        ApplicationEnd ();
    }
}
```
while (thread == thisThread) { 
    prev_time = now_time;
    do{
        now_time = System.currentTimeMillis();
    } while ((now_time - prev_time) < SYSTEM_SPEED);
    now_time = System.currentTimeMillis();
    long sleep_time = SYSTEM_SPEED + prev_time - now_time;
    if (sleep_time < 0)
        sleep_time = 1; /* yield anyway so other things can run */
    try {
        Thread.sleep(sleep_time);
    } catch (InterruptedException e) {
        ApplicationEnd();
    }
    if (thread != thisThread) return;
    now_time = System.currentTimeMillis();
    loop_rate = (now_time - prev_time) / SYSTEM_SPEED;
    if (loop_rate > 5.0f) { /* More than loop rate limit */
        loop_rate = 5.0f;
    }
    /* do game stuff here ... */
}
Programming Tricks

- Use per-object fog to highlight objects
- Use black fog for night time
- Draw large background objects last
- Draw large foreground objects first
- Divorce logic from representation

For some self-help using NetBeans see

J2ME MIDP Device Fragmentation Tutorial with Marv The Miner
Why Mobile Game Development is Hard

Severe limits on application size
  Download size limits
  Small Heap memory
Small screens
Poor input devices
Poor quality sound
Slow system bus and memory system
Why Mobile Game Development is Hard

No floating point hardware

No integer divide hardware

Many tasks other than application itself
  - Incoming calls or mail
  - Other applications

Short development period

Tight $100k – 250k budget
Memory

Problems

Small application/download size
Small heap memory size

Solutions

Compress data ①
Use single large file ①
Use separately downloadable levels ①
Limit contents ②
Optimize your Java: combine classes, coalesce var’s, eliminate temporary & local variables, … ②
Performance

Problems

- Slow system bus & memory
- No integer divide hardware

Solutions

- Use smaller textures
- Use mipmapping
- Use byte or short coordinates and key values
- Use shifts
- Let the compiler do it
User-Friendly Operation

Problems

- Button layouts differ
- Diagonal input may be impossible
- Multiple simultaneous button presses not recognized

Solutions

- Plan carefully
- Different difficulty levels
- Same features on multiple buttons
- Key customize feature
Many Other Tasks

Problem

- Incoming calls or mail
- Other applications

Solution

- Create library for each handset terminal
Agenda

- J2ME game development
- Tools
- COFFEE BREAK
- The structure of a MIDlet
- A walkthrough a sample game
- Why mobile game development is hard

Publishing your content
Publishing Your Content Agenda

Publishing your content

Preparing contents for distribution

– Getting published and distributed
Preparing for Distribution: Testing

Testing on actual handsets essential

May need contract with operator to obtain tools needed to download test MIDlets to target handset.

May need contractor within operator’s region to test over-the-air aspects as handset may not work in your area

Testing services are available

e.g. www.tirawireless.com
Preparing for Distribution: Signing

Java has 4 security domains:

- Manufacturer
- Operator
- 3rd Party
- Untrusted

Most phones will not install untrusted MIDlets.

If untrusted MIDlets are allowed, there will be limits on access to certain APIs.

Operators will not allow untrusted MIDlets in their distribution channels.
Preparing for Distribution: Signing

Your MIDlet must be certified and signed using a 3rd party domain root certificate.

Method varies by operator and country.

Many makers and operators participate in the Java Verified Program to certify and sign MIDlets for them.

To get certification, MIDlet must meet all criteria defined by JVP and must pass testing.
Publishing Your Content Agenda

Publishing your content

– Preparing contents for distribution

Getting published and distributed
Publishing Your Content: Distribution Channels

Game deck
  e.g. “More Games button”

Off deck, in portal
  e.g. AT&T Wireless’s Beyond MEdia Net

Off portal
  Independent of operator
  Premium SMS or web distribution
Distribution Channels: Game Deck

Customers find you easily

but many carriers only allow a few words of text to describe and differentiate the on-deck games

Operator does billing

No credit worries

Operator may help with marketing

or they may not

Shelf space limited
Distribution Channels: off Deck, in Portal

Hard to find you. Need viral marketing

Customers must enter search terms in operator’s search box

or find URL in some other way

Operator does billing, may help with marketing

May be able to get here without a publisher
Distribution Channels: off Deck, off Portal

Very hard for customers to find you

Only 4% of customers have managed to buy from the game deck!

You have to handle billing

Typical game prices of $2 - $6 too low for credit cards. Must offer subscription service for CC billing.

Nobody is going to enter your url then billing information on a 9-key pad and very few people will use a PC to buy games for their phone.

Premium SMS or advertiser funded are about the only ways.

You take all the risks

Some handsets/carriers do not permit off-portal downloads
Publishing Your Content
Billing Mechanisms

One-time purchase via micropayment
  Flat-rate data? ➔ Larger, higher-cost games

Subscription model via micropayment
  Episodic games to encourage loyalty
  Game arcades with new games every month

Sending Premium SMS
  Triggers initial download
  Periodically refills scarce supplies
Operator Revenue Share 1999 - 2004

% Of Revenue Share

- DoCoMo: 90%
- Orange WAP: 9%
- SKT: 10%
- AT&T: 20%
- Sprint PCS: 25%
- Verizon: 25%
- "GIN": 12%
- Vodafone Live: 50%
- Orange World: 60%
- Cingular: 35%
- SKT 3G: 30%

Going On-Deck

Find a publisher and build a good relationship with them

**Japan:** Square Enix, Bandai Networks, Sega WOW, Namco, Infocom, etc.

**America:** Bandai America, Digital Chocolate, EA Mobile, MForma, Sorrent

**Europe:** Digital Chocolate, Superscape, Macrospace, Upstart Games
Going Off-Deck

There are off-deck distribution services:

- thumbplay, www.thumbplay.com
- playphone, www.playphone.com
- gamejump, www.gamejump.com free advertiser supported games

These services may be a good way for an individual developer to get started

Backwards Compatible – Why?

Device vendors can drop out M3G 1.1
Rather than supporting both versions (forever)
Cuts integration, testing & maintenance into \( \sim \frac{1}{2} \)

Developers can upgrade gradually
Rather than re-doing all code, art, and tools
Backwards Compatible – How?

M3G 2.0 Core

M3G 1.1

M3G 2.0 Advanced
Backwards Compatible – How?

M3G 2.0 Core
M3G 1.1

M3G 2.0 Advanced

- Mandatory
- Optional
The Downsides

Must emulate fixed functionality w/ shaders
- Extra implementation burden

Need to drag along obsolete features
- Flat shading, Sprite3D, Background image, ...

The API has grown from 30 classes to 53
- An equivalent pure shader API would have ~40
Core vs. Advanced

High-level features are common to both

- Scene graph
- Animation

The differences are in rendering

- Core ➔ OpenGL ES 1.1
- Advanced ➔ OpenGL ES 2.0
What’s in the Core?

Everything that’s in M3G 1.1

Everything that’s in OpenGL ES 1.1
  Except for useless or badly supported stuff
  Such as points, logic ops, stencil, full blending

A whole bunch of new high-level features
What’s in the Advanced Block?

Everything that’s in OpenGL ES 2.0

- Vertex and fragment shaders
- Cube maps, advanced blending
- Stencil buffering
What’s not included?

Optional extensions of OpenGL ES 2.0

- Floating-point textures
- Multiple render targets
- Depth textures, 3D textures
- Non-power-of-two mipmaps
- Occlusion queries
- Transform feedback
M3G 2.0 Preview

Design

Fixed functionality

Programmable shaders

New high-level features

Summary, Q&A
M3G 2.0 Core vs. M3G 1.1

- New capabilities
- Better and faster rendering
- More convenient to use
- Fewer optional features
Point Sprites

- Good for particle effects
- Much faster than quads
- Consume less memory
- Easier to set up
Better Texturing

More flexible input

- JPEG, ETC (Ericsson Texture Compression)
- RGB565, RGBA5551, RGBA4444
- Can set & render to individual mipmap levels
- Dynamic sources (e.g. video)

Upgraded baseline requirements

- At least two texture units
- Arbitrary sizes up to at least 1024x1024
- Perspective correction, mipmapping, bilinear filtering
Texture Combiners

Precursor to fragment shaders

Quite flexible, but not very easy to use

Should be generated in the authoring tool chain
Bump Mapping

Fake geometric detail
Feasible even w/o HW
Bump Mapping + Light Mapping

Bump map modulated by projective light map
Floating-Point Vertex Arrays

**float (32-bit)**
- Easy to use, good for prototyping
- Viable with hardware acceleration

**half (16-bit)**
- Savings in file size, memory, bandwidth

**byte/short** still likely to be faster
Triangle Lists

Much easier to set up than strips
  Good for procedural mesh generation
  Avoids the expensive stripification

Sometimes even smaller & faster than strips
  Especially with a cache-friendly triangle ordering
## Primitives – M3G 1.x

<table>
<thead>
<tr>

<td>✓</td>
<td>✓</td>
<td>✓</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* OpenGL ES 1.1 only supports RGBA colors, M3G also supports RGB
Deprecated Features

- Background image
  - Use a sky box instead

- Sprite3D
  - Use textured quads or point sprites instead

- Flat shading
  - Can’t have this on OpenGL ES 2.0!
Deprecated Features Cont’d

Two-sided lighting
   Requires duplicated geometry on OpenGL ES 2.0

Local camera lighting (a.k.a. local viewer)
   Only a hint that was poorly supported

Less accurate picking
   Skinning and morphing not taken into account
M3G 2.0 Preview

Design
Fixed functionality

Programmable shaders

New high-level features

Summary, Q&A
Shading Language

GLSL ES v1.00

- Source code format only
- Binary shaders would break the Java sandbox

Added a few preprocessor `#pragma`'s

- To enable skinning, morphing, etc.
- Apply for vertex shaders only
The Shader Package

- Shader Appearance
  - Linked on construction, validated on first use
  - Compiled on construction
- Shader Program
  - Shaders
    - VertexShader
    - FragmentShader
  - Shader Uniforms
    - Linked on construction, validated on first use
  - Shader Uniforms
    - Compiled on construction
Why Multiple ShaderUniforms?

So that uniforms can be grouped

- Global constants – e.g. look-up tables
- Per-mesh constants – e.g. rustiness
- Per-frame constants – e.g. time of day
- Dynamic variables – e.g. position, orientation

Potential benefits of grouping

- Java object reuse – less memory, less garbage
- Can be faster to bind a group of variables to GL
A Fixed-Function Vertex Shader

A small example shader
Replicates the fixed-function pipeline using the predefined #pragma’s
Necessary Declarations

```c
#pragma M3Gvertex(myVertex)
#pragma M3Gnormal(myNormal)
#pragma M3Gtexcoord0(myTexCoord0)
#pragma M3Gcolor(myColor)

#pragma M3Gvertexstage(clipspace)

varying vec2 texcoord0;
varying vec4 color;
```

- **Names & roles for vertex attributes**
- **Transform all the way to clip space**
- **Variables to pass to the fragment shader**
void main() {
    m3g_ffunction();
    gl_Position = myVertex;
    texcoord0 = myTexCoord0.xy;
    color = myColor;
}

Applies morphing, scale/bias, skinning, model-view, projection

Results passed to the fragment shader
M3G 2.0 Preview

Design
Fixed functionality
Programmable shaders
New high-level features
Summary, Q&A
RenderPass

Automated render-to-texture (RTT)

First set up RenderTarget, World, Camera

Call `myWorld.preRender()`, e.g. every Nth frame

This updates all dynamic textures in the scene

Finally, render the World as usual

RTT effects can now be authored in DCC tools

Advanced FX without programmer intervention

Reflection, refraction, HDR bloom, etc.
Transparency Sorting

Can sort blended meshes back-to-front

Toggled on/off per Appearance and layer

Based on the Mesh origin’s depth in eye space

\[ \text{Depth} = \text{MODELVIEW\_MATRIX}(3, 4) \]

Individual triangles are **not** sorted
Level of Detail (LOD)

A Group node can select one of its children
Based on their estimated size in screen pixels
Similar to mipmap level selection

Formally

Compute LOD scale $s$ (in pixels per model-space unit)
Select the child $i$ whose resolution $r_i$ satisfies

$$\max \{r_i \mid r_i \leq s\}$$
Level of Detail (LOD)

Can have a different type of model at each level

- SkinnedMesh with 30 bones and 1000 vertices
- SkinnedMesh with 15 bones and 300 vertices
- MorphingMesh with 3 targets and 100 vertices
- Billboard with flip-book animation

Appearance detail can be scaled, too

- E.g. from complex shaders to per-vertex colors
Combined Morphing & Skinning

First morph, then skin the result

Useful for animated characters
  Morph targets for facial animation
  Skinning for the rest of the body

Can morph and/or skin any vertex attribute
  Use the result in your own vertex shader
  #pragma M3Gvertexstage(skinned)
Subset Morphing

Can morph an arbitrary subset of vertices

Previously, the whole mesh was morphed
Now the morph targets can be much smaller
Big memory savings in e.g. facial animation
Multichannel Keyframe Sequences

$N$ channels per KeyframeSequence

- Same number of keyframes in all channels
- Shared interpolation mode
- Shared time stamps

Huge memory savings with skinning

- M3G 1.1: two Java objects per bone (~60 / mesh)
- M3G 2.0: two Java objects per mesh
Bounding Volumes (BV)

Speed up view frustum culling & collisions
Processed hierarchically to cull entire branches

Can be specified for each node

Bounding sphere = center & radius
Bounding box (AABB) = min & max extents
If both are given, test the sphere first
If neither is given, use an internal BV
Collision Detection

Based on collision volumes – **not** triangles

k-DOP = AABB with corners & edges chopped off

`world.collision(...) to find all k-DOP collisions in the scene`
Other Stuff

Event tracks associated with animations

E.g. play a sound when a foot hits the ground

Lots of new convenience methods

`findAll(Class)` – find e.g. all Appearances

Can enable/disable animations hierarchically

Can use quaternions instead of axis/angle

Easy pixel-exact 2D projection for overlays

Easy look-at orientation for camera control

Predefined, intuitive blending modes
File Format

Updated to match the new API
- File structure remains the same
- Same parser can handle both old & new

Better compression for
- Textures (ETC, JPEG)
- SkinnedMesh, IndexBuffer
M3G 2.0 Preview

Design
Fixed functionality
Programmable shaders
New high-level features

Summary, Q&A
M3G 2.0 will replace 1.1, starting next year
Existing code & assets will continue to work

Several key improvements
Programmable shaders to the mass market
Fully featured traditional rendering pipeline
Advanced animation and scene management
Better perf across all device categories
Q&A

Thanks:
M3G 2.0 Expert Group
Dan Ginsburg (AMD)
Kimmo Roimela (Nokia)
Closing & Summary

We have covered

- OpenGL ES
- M3G

Let’s quickly see what else is there

- COLLADA
- 2D APIs: OpenVG, JSR 226, JSR 287
Khronos API family

OpenML
Dynamic Media Authoring

COLLADA
3D Authoring

Dynamic Media Authoring Standards

glFX
Open Standards Effects Framework

Bridging 3D Authoring and Acceleration for advanced visual effects

Family of Market-focused 3D APIs

OpenGL|SC
Safety Critical 3D

OpenGL
Cross platform desktop 3D

Embedded 3D

Application Acceleration APIs

OpenGL|ES
Embedded Media APIs

OpenMAX
Streaming Media

EGL
Surface and synch abstraction

OpenMAX AL
CODEC and media component portability

OpenMAX DL
Streaming Media System Integration

OpenMAX IL
Open Standards for window systems

OpenVG
Vector 2D

OpenSL|ES
Enhanced Audio

System Integration Standards

OpenKODE
Open Standards for window systems
An open interchange format
to exchange data between content tools
allows mixing and matching tools for the same project
allows using desktop tools for mobile content
Collada conditioning

Conditioning pipelines take authored assets and:

1. Strips out authoring-only information
2. Re-sizes to suit the target platform
3. Compresses and formats binary data for the target platform

Different target platforms can use the same asset database with the appropriate conditioning pipeline
2D Vector Graphics

OpenVG
- low-level API, HW acceleration
- spec draft at SIGGRAPH 05, conformance tests summer 06

JSR 226: 2D vector graphics for Java
- SVG-Tiny compatible features
- completed Mar 05

JSR 287: 2D vector graphics for Java 2.0
- rich media (audio, video) support, streaming
- may still complete in 07
OpenVG features

- Paints
- Stroke
- Image transformation
- Fill rule
- Mask
- Paths
OpenVG pipeline

- Definition of path, transformation, stroke and paint
- Stroked path generation
- Transformation
- Rasterization
- Clipping and Masking
- Paint Generation
- Image Interpolation
- Blending

Diagram showing the stages of the OpenVG pipeline:

1. Definition of path, transformation, stroke, and paint
2. Stroked path generation
3. Transformation
4. Rasterization
5. Clipping and Masking
6. Paint Generation
7. Image Interpolation
8. Blending and Antialiasing
JSR-226 examples

Game, with skins  Scalable maps, variable detail  Cartoon  Weather info
Combining various APIs

It’s not trivial to efficiently combine use of various multimedia APIs in a single application

EGL is evolving towards simultaneous support of several APIs

    OpenGL ES and OpenVG now

all Khronos APIs later
OpenGL ES and OpenVG

OpenGL ES
Accurately represents PERSPECTIVE and LIGHTING

OpenVG
Accurately represents SHAPE and COLOR

OpenVG ideal for advanced compositing user interfaces
OpenGL ES for powerful 3D UI effects
Summary

Handheld devices are viable 3D platforms
- OpenGL ES, M3G, COLLADA

2D vector graphics is also available
- JSR 226, Flash, OpenVG, JSR 287

Download the SDKs

and start coding on the smallest (physical size) yet largest (number of units) platform
