

Invariance in Property Testing

Madhu Sudan

Microsoft Research

This talk

- Introduce Property Testing
- Focus on special case of algebraic properties
 - (Aka Locally Testing of (algebraic) Codes)
- Some general results for codes/properties with special invariance.

Modern challenge to Algorithm Design

- Data = Massive; Computers = Tiny
 - How can tiny computers analyze massive data?
 - Only option: Design sublinear time algorithms.
 - Algorithms that take less time to analyze data, than it takes to read/write all the data.
 - Can such algorithms exist?

Yes! Polling ...

- Is the majority of the population Red/Blue
 - Can find out by random sampling.
 - Sample size \propto margin of error
 - Independent of size of population

- Other similar examples: (can estimate other moments ...)

Recent "novel" example

- Can test for homomorphisms:
 - Given: $f: G \rightarrow H$ (G, H finite groups), is f essentially a homomorphism?
 - Test:
 - Pick x, y in G uniformly, ind. at random;
 - Verify $f(x) \cdot f(y) = f(x \cdot y)$
 - Completeness: accepts homomorphisms w.p. 1
 - (Obvious)
 - Soundness: Rejects f w.p prob. Proportional to its "distance" (margin) from homomorphisms.
 - (Not obvious)

Brief History

- [Blum,Luby,Rubinfeld – S'90]
 - Linearity + application to program testing
- [Babai,Fortnow,Lund – F'90]
 - Multilinearity + application to PCPs (MIP).
- [Rubinfeld+S.]
 - Low-degree testing
- [Goldreich,Goldwasser,Ron]
 - Graph property testing
- Since then ... many developments
 - Graph properties
 - Statistical properties
 - ...
 - More algebraic properties

Property Testing

- Data = a function from D to R :
 - Property $P \subseteq \{D \rightarrow R\}$
- Distance
 - $\delta(f,g) = \Pr_{x \in D} [f(x) \neq g(x)]$
 - $\delta(f,P) = \min_{g \in P} [\delta(f,g)]$
 - f is ε -close to g ($f \approx_\varepsilon g$) iff $\delta(f,g) \leq \varepsilon$.
- Local testability:
 - P is (t, ε, δ) -locally testable if \exists t -query test T
 - $f \in P \Rightarrow T^f$ accepts w.p. $1-\varepsilon$.
 - $\delta(f,P) > \delta \Rightarrow T^f$ accepts w.p. ε .
- Notes: want $t(\varepsilon, \delta) = O(1)$ for $\varepsilon, \delta = \Omega(1)$.

Locally Testable Codes

- Intriguing aspect of BLR test:
 - Property $P = \{\text{first order Reed-Muller codes}\}$
(A Hadamard Code)
- Motivates "Locally Testable Code" (LTC):
 - Property $P = \{\text{Error-correcting code}\}$
 - t-LTC: Testable with $t(n)$ queries.
- Are there better rate LTCs than Hadamard?
 - Yes – example 1: RM codes.
 - Yes ... many more sophisticated ones.
- Natural motivation: Can test massive DVD for "too many" errors

Why is BLR special?

Why is BLR special?

- Impressive collection of generalizations, alternate proofs, applications (all of PCP, LTC theory, e.g.)?
- Why is it more interesting than just polling?
- Why did the proof work? Was it a one-shot thing?
- Most previous attempts to extend “broadly” failed
...

BLR Analysis

- Fix f s.t. $\text{Rej}(f) = \Pr_{x,y} [f(x) + f(y) \neq f(x+y)] < \epsilon$
- Define $g(x) = \text{majority}_y \{ \text{Vote}_x(y) \}$,
where $\text{Vote}_x(y) = f(x+y) - f(y)$.
- Step 0: Show $\delta(f,g)$ small
- Step 1: $\forall x, \Pr_{y,z} [\text{Vote}_x(y) \neq \text{Vote}_x(z)]$ small.
- Step 2: Use above to show g is well-defined and a homomorphism.

Key Step: Step 1

- Why is $f(x+y) - f(y) = f(x+z) - f(z)$, usually?

(Note: Prob over y,z for fixed x .)

- Proof:
 - $f(x+y) + f(z) = f(x+y+z)$ [w.h.p.]
= $f(x+z) + f(y)$ [w.h.p. again]
- Proof from the Book.
 - (Indisputable! Inexplicable!)

Extensions

- [Rubinfeld + S. 92-96]: Low degree tests
- [Rubinfeld 94]: Functional equations
- [ALMSS, etc.]: PCP theory
- [AKKLR 02]: Reed-Muller tests
- [KaufmanRon, JPRZ]: Generalized RM tests.
 - ... each time a new proof of key step.

Abstraction of BLR (in special case)

- Restrict to $G = F^n$ and $H = F$
($F =$ finite field; with q elements)
- Property:
 - **Linear:** (sum of linear functions is linear)
 - **Locally characterized:** $\forall x, y \ f(x) + f(y) = f(x+y)$
 - **Linear-invariant:** Linear function remains linear after linear transformation of domain.
 - **Single-orbit:** Constraints above given by one constraint and implication of linear-invariance.
- **Our hope:** Such abstractions explain, extend and unify algebraic property testing.

Invariances

- Property P invariant under permutation (function) $\pi: D \rightarrow D$, if
$$f \in P \Rightarrow f \circ \pi \in P$$
- Property P invariant under group G if
$$\forall \pi \in G, P \text{ is invariant under } \pi.$$
- Can ask: Does invariance of P w.r.t. "nice" G leads to local testability?

Invariances are the key?

- “Polling” works well when (because) invariant group of property is the full symmetric group.
- Modern property tests work with much smaller group of invariances.
- Graph property \sim Invariant under vertex renaming.
- Algebraic Properties & Invariances?

Example motivating symmetry

- Conjecture (AKKLR '96):
 - Suppose property P is a vector space over F_2 ;
 - Suppose its "invariant group" is "2-transitive".
 - Suppose P satisfies a t -ary constraint
 - $\forall f \in P, f(\alpha_1) + \dots + f(\alpha_t) = 0.$
(dual(P) has distance $\leq t$)
 - Then P is $(q(t), \epsilon(t, \delta), \delta)$ -locally testable.
- Inspired by "low-degree" test over F_2 . Implied all previous algebraic tests (at least in weak forms).

Affine-invariance & testability

Abstracting Algebraic Properties

- [Kaufman & S.]
- Range is a field F and P is F -linear.
- Domain is a vector space over F (or some field K extending F).
- Property is invariant under affine (sometimes only linear) transformations of domain.
- "Property characterized by single constraint, and its orbit under affine (or linear) transformations."

Terminology

- **t-Constraint**: Sequence of t elements of domain, and set of forbidden values for this sequence.

$$\text{e.g. } f(a) + f(b) = f(a+b)$$

- **t-characterization**: Collection of t -constraints, satisfaction of which is necessary and sufficient criterion for satisfying property

$$\text{e.g. } f(a) + f(b) = f(a+b), f(c) + f(d) = f(c+d) \dots$$

[t -LDPC]

- **t-single-orbit characterization**: One k -constraint such that its translations under affine group yields k -characterization.

$$f(L(a)) + f(L(b)) = f(L(a+b)) ; a, b \text{ fixed, all linear } L.$$

Affine-invariance & testability

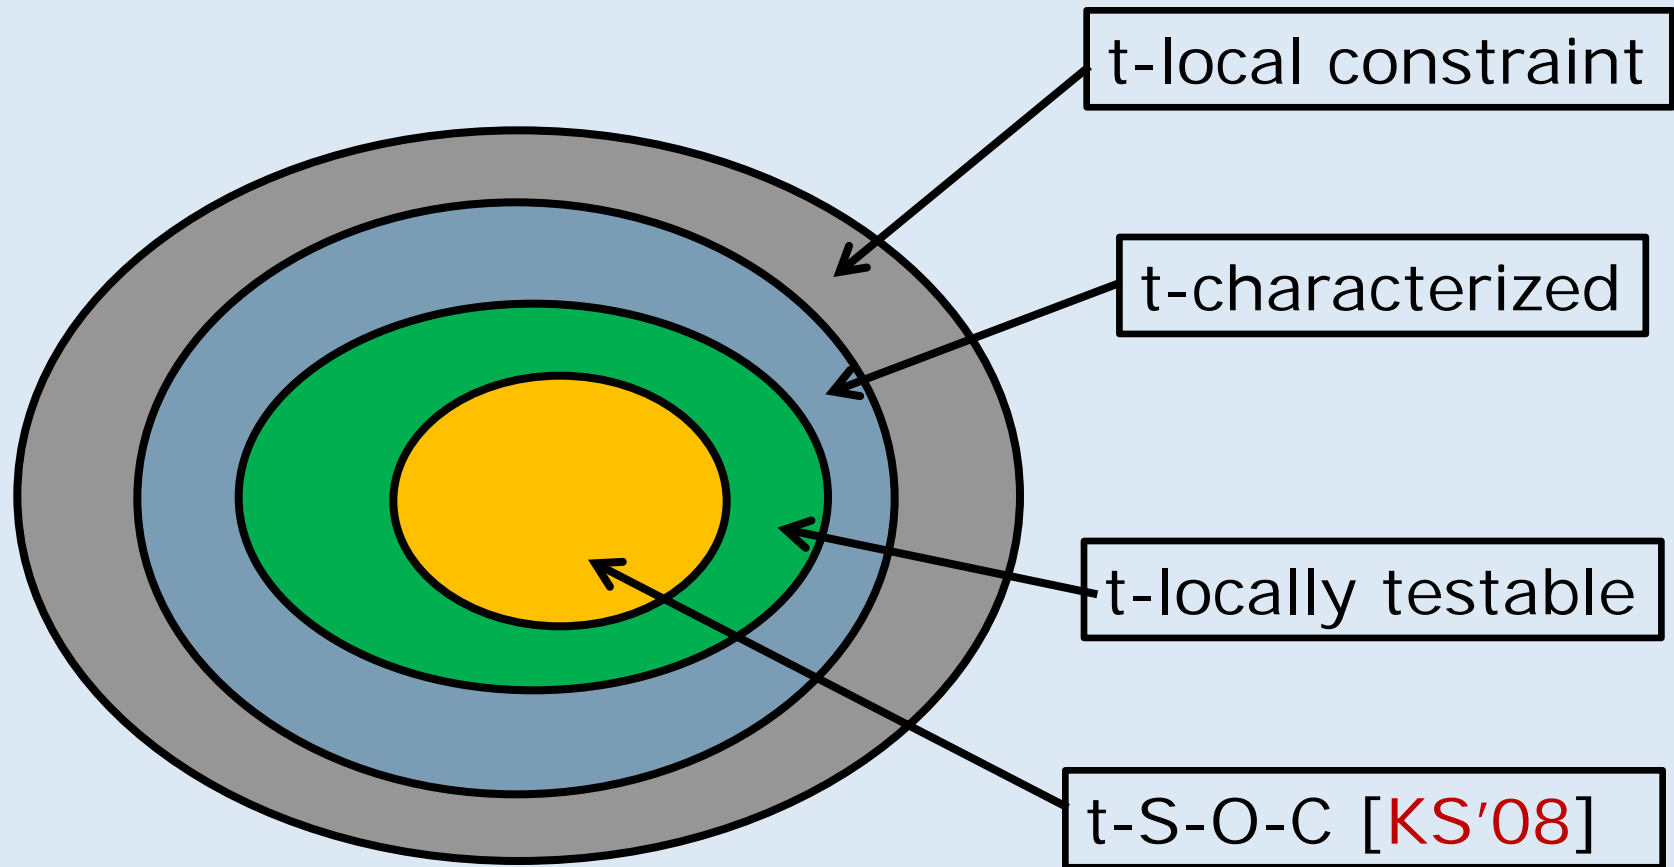

Main Results

Some results

- If P is affine-invariant and has t -single orbit characterization then it is $(t, \delta/t^3, \delta)$ -locally testable.
 - Unifies previous algebraic tests (in basic form) with single proof.

Affine-invariance & testability

Analysis of Invariance-based test

- Property P given by $\alpha_1, \dots, \alpha_t; V \subseteq F^k$
- $P = \{f \mid (f(A(\alpha_1)), \dots, f(A(\alpha_t))) \in V, \forall \text{ affine } A: K^n \rightarrow K^n\}$
- $\text{Rej}(f) = \text{Prob}_A [(f(A(\alpha_1)), \dots, f(A(\alpha_t))) \notin V]$
- Wish to show: If $\text{Rej}(f) < 1/t^3$,
then $\delta(f, P) = O(\text{Rej}(f))$.

BLR Analog

- $\text{Rej}(f) = \Pr_{x,y} [f(x) + f(y) \neq f(x+y)] < \epsilon$
- Define $g(x) = \text{majority}_y \{ \text{Vote}_x(y) \}$,
where $\text{Vote}_x(y) = f(x+y) - f(y)$.
- Step 0: Show $\delta(f,g)$ small
- Step 1: $\forall x, \Pr_{y,z} [\text{Vote}_x(y) \neq \text{Vote}_x(z)]$ small.
- Step 2: Use above to show g is well-defined and a homomorphism.

Generalization

- $g(x) = \beta$ that maximizes, over A s.t. $A(\alpha_1) = x$,
 $\Pr_A [(\beta, f(A(\alpha_2)), \dots, f(A(\alpha_t))) \in V]$
- Step 0: $\delta(f, g)$ small.
- $\text{Vote}_x(A) = \beta$ s.t. $(\beta, f(A(\alpha_2)), \dots, f(A(\alpha_t))) \in V$
(if such β exists)
- Step 1 (key): $\forall x$, whp $\text{Vote}_x(A) = \text{Vote}_x(B)$.
- Step 2: Use above to show $g \in P$.

BLR Analysis of Step 1

- Why is $f(x+y) - f(y) = f(x+z) - f(z)$, usually?

?	$f(z)$	$-f(x+z)$	
$f(y)$	0	$-f(y)$	←
$-f(x+y)$	$-f(z)$	$f(x+y+z)$	←

Matrix Magic?

Say $A(\alpha_1) \dots A(\alpha_s)$ independent;
rest dependent

Results (contd.)

- Thm 2: If P is affine-invariant over K and has a single t -local constraint, then it has a q -single orbit feature (for some $q = q(K,t)$)
- Proof ingredients:
 - Analysis of all affine invariant properties.
 - Characterization of all affine invariant properties in terms of degrees of monomials in support of polynomials in family
 - Rough characterization of locality of constraints, in terms of degrees.
- Infinitely many (new) properties ...

Results from [KS '08]

- Thm 1: If P is affine-invariant and has t -single orbit feature then it is $(t, \delta/t^3, \delta)$ -locally testable.
 - Unifies previous algebraic tests with single proof.
- Thm 2: If P is affine-invariant over K and has a single t -local constraint, then it has a q -single orbit feature (for some $q = q(K, t)$)
 - (explains the AKKLR optimism)
- Completely characterizes local testability of affine-invariant properties over vector spaces over small fields.

Vector spaces over big fields?

- Most general case:
 - $f : K \rightarrow F^m$
 - Most interesting cases
 $K = \text{huge field}; F, m \text{ small.}$
- Reasons to study:
 - Broader class: Potential counterexamples to intuitive beliefs.
 - Include starting point for all LTCs (so far).

Subsequent results

- [GrigorescuKaufmanS'08]: 1st Counterexample to AKKLR Conjecture (t-local constraint \neq t-LDPC.)
- [GrigorescuKaufmanS.'09]: Single orbit characterization of some BCH (and other) codes.
- [Ben-SassonS.'11]: Limitations on rate of ($O(1)$ -locally testable) affine-invariant codes.
- [Ben-SassonMaatoukShpilkaS.'11]: 2nd counterexample to AKKLR (t-LDPC \neq t-testable)
- [above+Grigorescu'11]: Sums of SOC are SOC.
- [KaufmanWigderson]: LDPC codes with invariance (not affine-invariant)
- [Bhattacharyya et al.]: Affine-invariant non-linear properties.

Affine-invariance & testability

Technical nature of questions

- Given: t points $\alpha_1, \dots, \alpha_t$ from K ;
and set of positive integers D ,

When is the $t \times |D|$ generalized Vandermonde matrix with columns indexed by $[t]$ and rows by D , with (i,d) th entry being α_i^d , of full column rank?

- Nice connections to symmetric polynomials, and we have new results (we think).

Other Invariances

- [KaufmanWigderson]: LDPC codes with invariance (not affine-invariant; probably not LTC).
- [Bhattacharyya et al. '09...'11]: Linear-invariant non-linear properties.

Broad directions to consider

- What groups of invariances lead to testability?
- Is there a subclass of affine-invariant codes that will lead to linear-rate LTCs? ($n^{o(1)}$ -locally testable with linear rate?)
 - (General program):
 - To understand structure.
 - To understand locality vs. structure.
 - To get new performance parameters.
- In general ... seek invariances

Thanks
