CTSS BULLETIN #3

1. **Foreground Library**

The subroutine (TSH) has been modified to make use of the
disk routine's error return. This allows (TSH) to drop
an input file from active status when an end-of-file is
encountered during input. A new entry, SNAP, will appear
in the transfer vector of (TSH). In addition, when errors
occur during input (TSH) will now print the absolute locations,
within (TSH), of the present call to the disk routine. (TSH)
and (CSH) are now independent subroutines, rather than two
entries to the same subroutine.

2. **FAPDBG**

The prefix codes (i.e., PZE, PON, etc.) have been added.
The memory bound comment is printed out only when the
memory bound has changed. The STR, TNX, and BCD errors
have been corrected.
