CTSS BULLETIN #9

## Foregound Library

Subject:   New Entries

1.   There are now subroutinized entries to the supervisor
     for the following calls:

```
        TSX     $GETLØC,4       Returns a specified
        PZE     LØC             location from core A.
        SLW     WØRD

        CAL     WØRD            Sets a specified location
        TSX     $SETLØC,4       in core A.  (Accessible only
        PZE     LØC             for M1416 users).

        TSX     $.ERASE,4       Deletes file FILNAM from
        PZE     FILNAM          user's directory.  The
      (+PZE     ERRØR)          tracks are not made available
                                for new writing until the
                                next system loading.
```

2.   SYPAR.  (System parameters)

Returns information similar to that printed by the SD
command.

Calling sequence:

```
        PARAM = SYPAR. (code)           in MAD

        TSX     $SYPAR,4                in FAP
        PZE     =(code)
        STØ     PARAM
```

where the value of "code" specifies the requested parameter:

```
        0               Nothing
        1               Last common location not used
        2               Common length
        3               First location loaded
        4               Program length
        5               System name
   6 to 9               Reserved
  10 to 32767           Location in core A
```
