

Basic System

1. Minimum Hardware definition.
Gives enough info about configuration to load a
kernel loader program.

2. Basic System Definition. List of modules of

1. Basic File System

2. BIOS adapter

3. Traffic Controller

Physical location of
+ ~~Base address~~ of root directory.

1 per system

operational system

3. Complete Hardware Configuration.

1 per system

4. Operational System definition

1 per system

List of document, operators, operator messages,
logix mechanism, ring library.

User System

5. User System definition

Cont'd to 1 per user

List of location of libraries, process definitions

+ Search Algorithm

Primary Names of System Given in user profile.

User system = primary name selecta system
secondary name " version
e.g., alpha. dbg 2A4

Primary name given in user profile. ~~points to a file~~

~~File contains list of libraries and~~, or alpha.*
or alpha. 2A4

~~Update~~

If * is in name, login looks up current system name

in ^{the current} system base (part of operating system) to create name alpha. 2A4

this is the name of a file containing the ^{and search module} list of libraries to be placed

in the given profile.
