

MPL-7

March 14, 1969

TO: Multics Performance Log  
FROM: R. J. Feiertag  
SUBJECT: Change in Page Fault Distribution

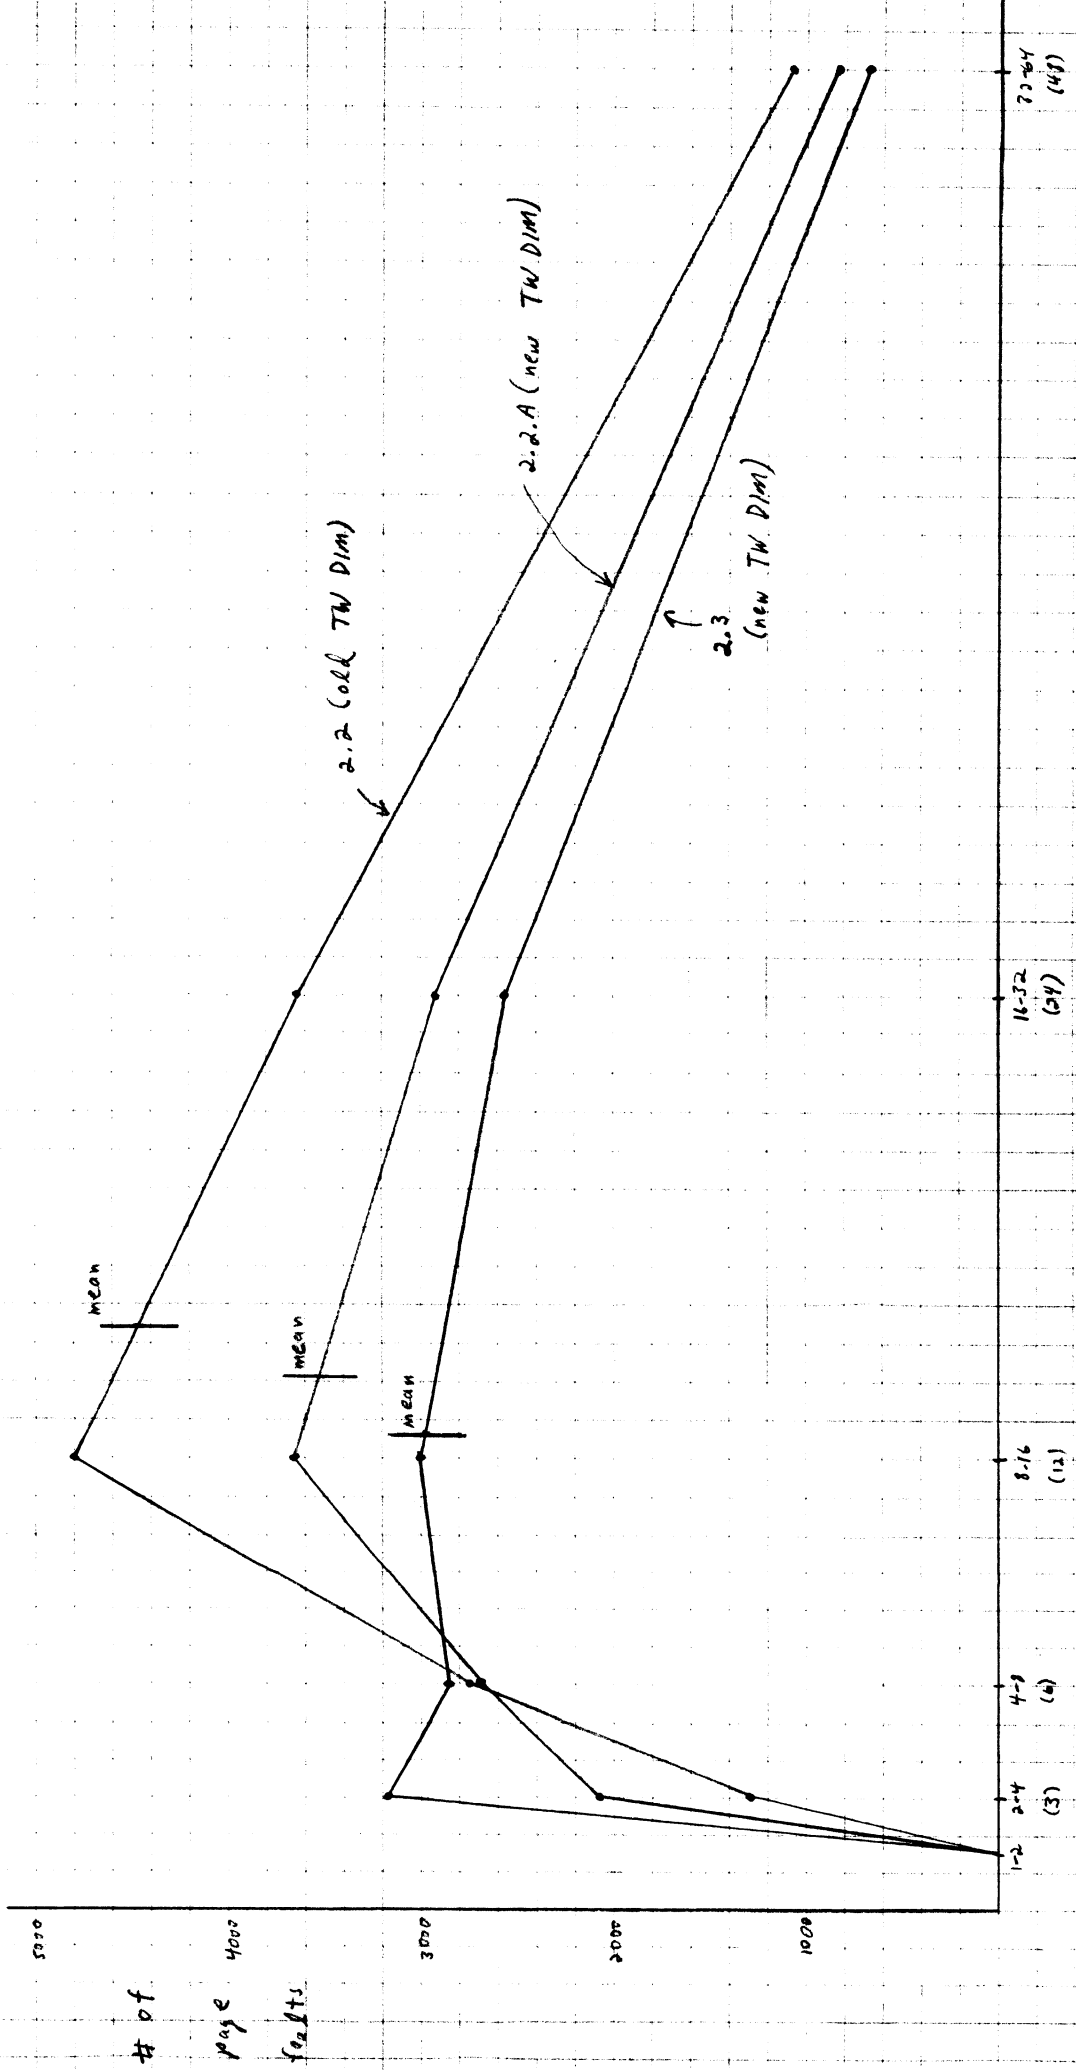

The enclosed chart is an updated version of the chart issued March 4. This chart includes the page fault distribution for system 2.3. As was mentioned in the earlier log entry, the change in average page fault time between 2.2 and 2.2A is due to the inclusion of the new typewriter DIM. There is as yet no substantiated explanation for the change in the mean time from 2.2A to 2.3 since there are no significant differences between these systems.
