Identification

Interpreter
W. H. Southworth

(Note that the following is an Abstract, which should
be replaced by a full description at a later time.)

Function of Entry:

A variant of the listener; takes a command line,
types it out in red, types a wait message, calls
the shell, types a ready message and returns to the
caller. The first call causes a "system certification"
message to be printed.

The "totals" entry types out the total real time,
compute time and page waits accumulated since the
first call in a given process. The totals are <u>not</u>
reset.

Calling Sequence for Entry:

call interpreter (string);

call interpreter$totals;

Declaration of Arguments:

dcl string char(*);

Description of Arguments:

"string" is any command line acceptable to the shell.
