Identification

Appendix to BX.14.02
R. H. Thomas

The following are differences between the post_binder
described in BX.14.02 and the post_binder running under
6.36.

(1)   The post_binder is called directly from the binder
      and can be used only immediately following a
      binding run.

(2)   Intra-segment references are made direct but no
      deletion of information occurs.
