

Chance-constrained Probabilistic Simple Temporal Problems

Cheng Fang Peng Yu Brian C. Williams

MIT CSAIL

July 31, 2014

Problem characteristics

- ▶ Uncertain durations in logistics
 - ▶ Traversal time of AUV $\sim N(20, 4)$;
 - ▶ Eruption relative to 8am $\sim N(60, 25)$;
- ▶ Timing requirements
- ▶ Require: Guarantee on probability of success

Example problem

Require 99% probability of success

Example: Risk averse approach

- ▶ Minimize probability of failure
- ▶ Resulting: close to $7.70 \times 10^{-5}\%$ probability of failure
- ▶ Departure: 84 minutes after SoD

Example: Risk averse approach

- ▶ Minimize probability of failure
- ▶ Resulting: close to $7.70 \times 10^{-5}\%$ probability of failure
- ▶ Departure: 84 minutes after SoD
- ▶ Conservative?

Example: Risk averse approach

- ▶ Minimize probability of failure
- ▶ Resulting: close to $7.70 \times 10^{-5}\%$ probability of failure
- ▶ Departure: 84 minutes after SoD
- ▶ Conservative?
- ▶ Probably: much safer than it needs to be

Example: STNU approach

- ▶ Map distributions to set-bounded uncertainty
 - ▶ Unbounded distribution - try mapping 3- σ bound
- ▶ Solve with standard STPU algorithms
- ▶ Departure: 61 minutes after SoD

Example: STNU approach

- ▶ Map distributions to set-bounded uncertainty
 - ▶ Unbounded distribution - try mapping $3\text{-}\sigma$ bound
- ▶ Solve with standard STPU algorithms
- ▶ Departure: 61 minutes after SoD
- ▶ Still conservative? Are these the best uncertainty bounds?

Chance-constrained probabilistic STP

- ▶ Given:
 - ▶ Set of controllable time points
 - ▶ Set of uncontrollable durations
 - ▶ Set of temporal constraints
 - ▶ Δ upper bound on the probability of failure

Chance-constrained probabilistic STP

- ▶ Given:
 - ▶ Set of controllable time points
 - ▶ Set of uncontrollable durations
 - ▶ Set of temporal constraints
 - ▶ Δ upper bound on the probability of failure
- ▶ Find:
 - ▶ Assignment to controllable time points
 - ▶ Uncertainty bounds on uncontrollable durations

Chance-constrained probabilistic STP

- ▶ Given:
 - ▶ Set of controllable time points
 - ▶ Set of uncontrollable durations
 - ▶ Set of temporal constraints
 - ▶ Δ upper bound on the probability of failure
- ▶ Find:
 - ▶ Assignment to controllable time points
 - ▶ Uncertainty bounds on uncontrollable durations
- ▶ Such that:
 - ▶ Time points optimal for utility function V
 - ▶ Temporal constraints consistent with probability at least Δ

Chance-constrained probabilistic scheduling

- ▶ Use probabilistic descriptions of uncertainty
- ▶ Explicitly schedule with probabilistic guarantees
- ▶ Optimise schedule

Chance-constrained probabilistic scheduling

- ▶ Use probabilistic descriptions of uncertainty
- ▶ Explicitly schedule with probabilistic guarantees
- ▶ Optimise schedule
- ▶ Key insight: **encode as constrained optimisation and allow solver to choose bounds!**

Chance-constrained probabilistic scheduling

- ▶ Use probabilistic descriptions of uncertainty
- ▶ Explicitly schedule with probabilistic guarantees
- ▶ Optimise schedule
- ▶ Key insight: **encode as constrained optimisation and allow solver to choose bounds!**
- ▶ Risk allocation: makes best use of available risk

Intuition behind risk allocation

► Intuition:

Intuition behind risk allocation

- ▶ Intuition:
 1. Cut off tail ends of distributions

Intuition behind risk allocation

► Intuition:

1. Cut off tail ends of distributions
2. Union bound \Rightarrow require $\sum_{tails} P(tails) \leq \Delta$

Intuition behind risk allocation

► Intuition:

1. Cut off tail ends of distributions
2. Union bound \Rightarrow require $\sum_{tails} P(tails) \leq \Delta$
3. Test set bounded durations for strong controllability

Constraints

Constr. Opt.

$$\begin{aligned} &\min V(x) \\ \text{st. } &Ax \leq b \\ &F(x) \leq c \end{aligned}$$

Example: CC-pSTP approach

- ▶ Optimised time, for 99% probability of success: **57.775** minutes after SoD

Example: CC-pSTP approach

- ▶ Optimised time, for 99% probability of success: **57.775** minutes after SoD
- ▶ Comparison:
 - ▶ Risk minimisation: 84 minutes
 - ▶ Manual bounds: 61 minutes

Example: CC-pSTP approach

- ▶ Optimised time, for 99% probability of success: **57.775** minutes after SoD
- ▶ Comparison:
 - ▶ Risk minimisation: 84 minutes
 - ▶ Manual bounds: 61 minutes
- ▶ Uncertainty bounds: $[14, 30]$ and $[36, 72]$

Simulation sets

- ▶ Based on Zipcars
- ▶ Schedule for 6 hour period
- ▶ Up to 20 cars
- ▶ Up to 5 users each car
- ▶ Up to 3 goal locations for each user
- ▶ Traversal durations based on a map of Boston
- ▶ 1800 cases

Number of solutions v constraints

		Number of activities to schedule			
		≤ 10	11 – 20	21 – 30	> 31
Risk 10%	Even distribution solutions	0	0	0	0
	cc-pSTP solutions	143	16	1	1
Risk 20%	Even distribution solutions	0	0	0	0
	cc-pSTP solutions	146	17	1	1
Risk 40%	Even distribution solutions	28	0	0	0
	cc-pSTP solutions	151	19	1	1
Risk minimisation solutions		161	22	2	1
Total number of Scenarios		428	230	165	977

Probability of success

Method	$P(\text{Success}) (\pm 1 - \sigma)$
10% cc-pSTP	0.9012 ± 0.0018
20% cc-pSTP	0.8059 ± 0.0051
40% cc-pSTP	0.6250 ± 0.0198
Min. Risk	0.9372 ± 0.1801

Conservatism

Method	Improvement over risk min
10% cc-pSTP	5.37%
20% cc-pSTP	6.58%
40% cc-pSTP	6.82%

Contributions

- ▶ Currently: set-bounded uncertainty in scheduling
- ▶ Previous probabilistic approach: risk minimisation
- ▶ New approach: chance-constrained probabilistic scheduling
- ▶ Key: set uncertainty bounds via chance-constrained optimisation
- ▶ Outcomes:
 - ▶ Guarantee on success
 - ▶ Less conservatism

Reduction constraints

Reduction:

- ▶ l_x, u_x bounds for probabilistic $t_x - t_0$
- ▶ $t_0 - t_1 + l_x \geq a$
 $-t_0 + t_1 - u_x \geq -b$

Reduction constraints

Reduction:

- ▶ l_x, u_x bounds for probabilistic $t_x - t_0$
- ▶ $t_1 - t_0 - u_x \geq a$
 $-t_1 + t_0 + l_x \geq -b$

Reduction constraints

Reduction:

- ▶ l_x, u_x bounds for probabilistic $t_x - t_0$
- ▶ l_y, u_y bounds for probabilistic $t_y - t_1$
- ▶ $t_0 - t_1 + l_x - u_y \geq a$
 $-t_0 + t_1 - u_x + l_y \geq -b$

Chance constraints

- ▶ Let Δ upper bound on failure probability
- ▶ Each uncertain duration d has cdf F_d , bounds l_d, u_d
- ▶ Require

$$\sum_{d \in R_d} F_x(l_d) + (1 - F_d(u_d)) \leq \Delta$$

R_d set of all uncertain durations
