

Plan

- Recap on ROW
- The Evaluation Section
- Debate: "Zoom should use ROW to improve the quality of our video chats."

Logistics

- * DP Prep report due 2/20
- * Mid-semester feedback form
- * For Tuesday: DCTCP

Recap: Goal of RON

1) Route quickly around outages / link failures

2) Applications can determine routing policy

3) Expressive routing policy

Zoom audio call
+ latency

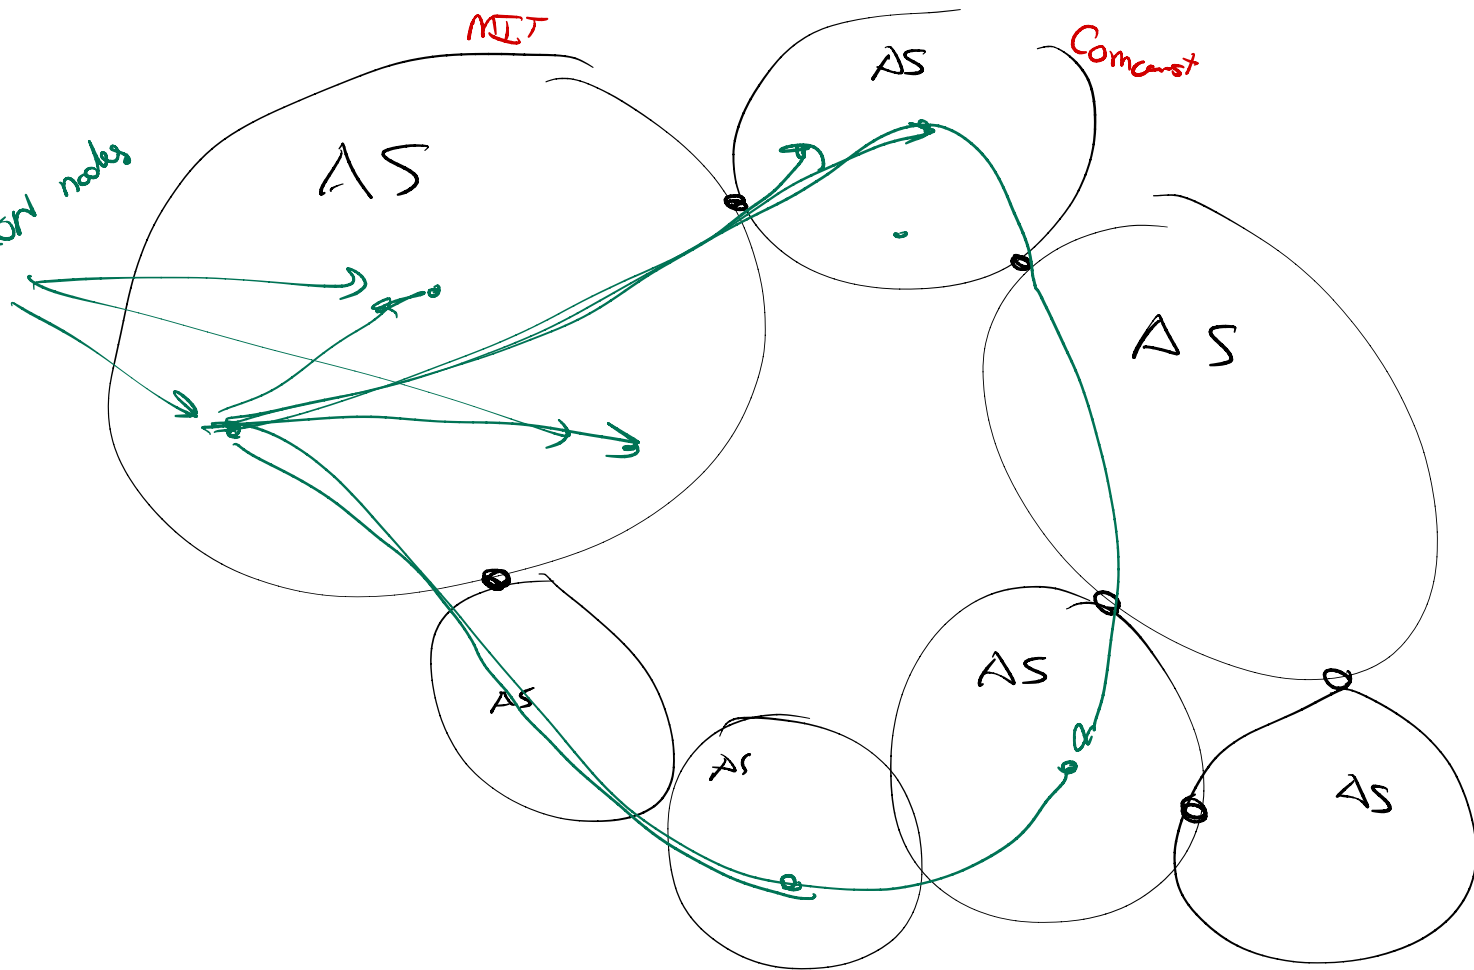

streaming online
+ throughput

Row nodes

MIT

Comcast

In science, what is the goal of an experiment?

* Test a hypothesis
↳ Earth is flat? → Acc/reject] Is the system good?

* Collect data — measure
↳ Speed of light
↳ Acc due to gravity.] How good is latency/
throughput?

* [In engineering] Compare costs/perf/-----] Better than nothing?
↳ Engine efficiency

A Debate

Resolved: Zoom should implement RON to improve video experience for out ~ 20 person Zoom calls?

Even room: In Favor

Odd room: Against

For

- + Lower latency
- + Remove load from central server
- + Centralized routing \rightarrow scale
- + Help during dropped calls

Against

- Scalability
- Routing flexibility not useful
- Latency can be worse
 - \hookrightarrow during outages
- Security

Plan

- Recap on ROW
- The Evaluation Section
- Debate: "Zoom should use ROW to improve the quality of our video chats."

Logistics

- * ~~DP~~ Prep report due 2/20
- * Mid-semester feedback form
- * For Tuesday: DCTCP

Recap: Goal of RCV

- 1) failure recovery \rightarrow routing around not failures quickly.
- 2) Path selection - application choose route more precisely
- 3) Framework for implementing "expressive" routing policies

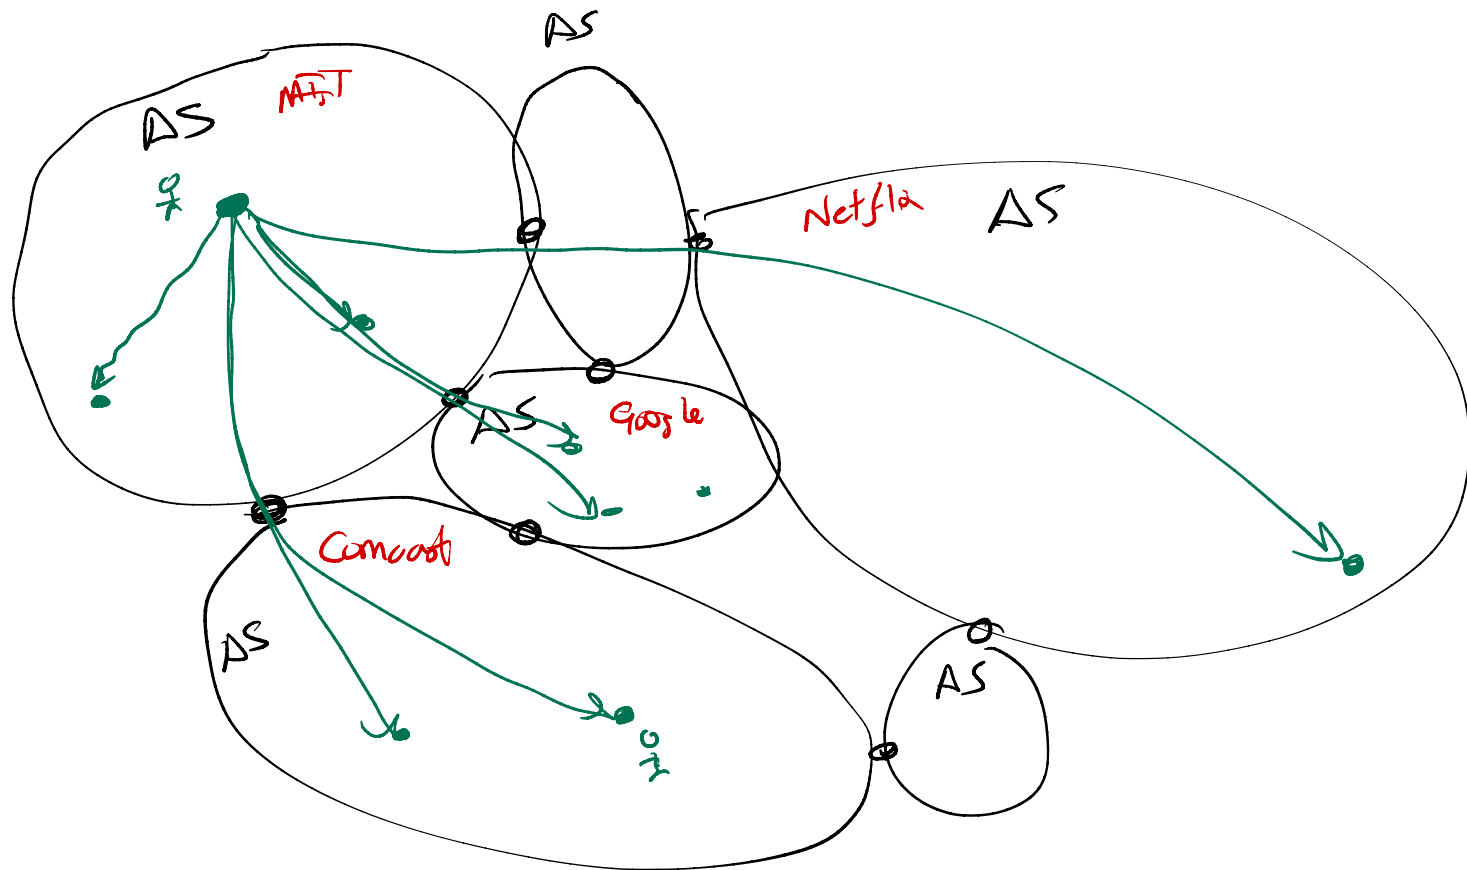

Video streaming

- low latency
- high bandwidth ~~✗~~
- low packet loss

audio chat

- low latency ~~✗~~
- high bandwidth
- low packet loss

In science, what is the goal of an experiment?

* Test a hypothesis

↳ Does X work how we expect?

* See how well your solution works
(quantitative variant)

* how quickly can
recover
* bandwidth compression
*
⋮

* [Engineering] Compare A vs. B
How much better are we than Internet?

A Debate

Resolved: Zoom should implement
improve video experience
Zoom calls
RON to
for ~20-person

Even room: In Favor

Odd room: Against

For

- ++ Could potentially reduce latency
- ++ Scales large enough for
 - ~20 person Zoom call
- ++ Packet loss is important
 - + Useful when latency is high
- ++ Vx only in small rooms
 - + Sending audio over diff path

Against

- Wouldn't scale
 - Tries to handle packet errors
 - Latency could increase
-
- Best for routing other people's data
 - Benefits not worth cost
 - ↳ often, single person's wifi network
 - NAT
 - Security !?
