

Part 2 – Learned Data Structures and Algorithms

Tim Kraska <kraska@mit.edu>

First part can be found here:

<https://stratos.seas.harvard.edu/files/stratos/files/learnedselfdesignedsystemssigmod2019tutorialpart1.pdf>

4.5 Ways to Instance Optimized Algorithms and Data Structures

1. Configure/synthesize traditional algorithm using a model

Fundamental Building Blocks

Fundamental Algorithms & Data Structures

B-Tree

Tim Kraska, Alex Beutel, Ed H. Chi, Jeffrey Dean, Neoklis Polyzotis:
The Case for Learned Index Structures. SIGMOD Conference 2018: 489-504

Does It Work? A First Attempt

State-Of-The-Art
B-Tree

260ns

TensorFlow

>80,000ns

Challenges

Traditional model architectures
do not work

Frameworks are not designed
for nano-second execution

Overfitting can be good

ML+System Co-Design

Challenges

Traditional model architectures
do not work

Frameworks are not designed
for nano-second execution

Overfitting can be good

ML+System Co-Design

What model type should I use?

What model type should I use?

Whatever works!

What model type should I use?

Whatever works!

- Often continuous functions
- Possible model types include neural nets, regression models, piece-wise linear functions, among other things
- Model-type can be auto-tuned
- Opens up a complete new toolbox of building data structures and algorithms

Challenges

Traditional model architectures
do not work

Frameworks are not designed
for nano-second execution

Overfitting can be good

ML+System Co-Design

Overfitting is a Good Thing

The Last Mile Problem

Overfitting is a Good Thing

Index over 100M records. Page-size: 100

Solution

Traditional model architectures
do not work

Frameworks are not designed
for nano-second execution

Overfitting can be good

ML+System Co-Design

Recursive-Model Index (RMI)

2-Stage RMI with Linear Model

$$\text{pos}_0 = a_0 + b_0 * \text{key}$$

$$\text{pos}_1 = m_1[\text{pos}_0].a + m_1[\text{pos}_0].b * \text{key}$$

$$\text{record} = \text{local-search}(\text{key}, \text{pos}_1)$$

Hybrid RMI

Worst-Case Performance is the one of a B-Tree

Solution

Traditional model architectures
do not work

Frameworks are not designed
for nano-second execution

Overfitting can be good

ML+System Co-Design

The Learning Index Framework (LIF)

- An index synthesis system
- Given an index configuration generate the best possible code
- Uses ideas from Tupleware [VLDB15]
- Simple models are trained “on-the-fly”, whereas for complex models we use Tensorflow and extract weights afterwards (i.e., no Tensorflow during inference time)
- Best index configuration is found using auto-tuning (e.g., see TuPAQ [SOCC15])

My Own Comparison

A Comparison To ARTful Indexes (Radix-Tree)

Viktor Leis, Alfons Kemper, Thomas Neumann: **The Adaptive Radix Tree: ARTful Indexing for Main-Memory Databases.** ICDE 2013

Experimental setup:

- Dense: continuous keys from 0 to 256M
- Sparse: 256M keys where each bit is equally likely 0 or 1.

A Comparison To ARTful Indexes (Radix-Tree)

Viktor Leis, Alfons Kemper, Thomas Neumann: **The Adaptive Radix Tree: ARTful Indexing for Main-Memory Databases**. ICDE 2013

Experimental setup: continuous keys from 0 to 256M

Reported lookup throughput: **10M/s $\approx$ 100ns⁽¹⁾**

Size: not measured, but paper says overhead of ≈ 8 Bytes per key (dense, best case): **256M * 8 Byte $\approx$ 1953MB**

⁽¹⁾Numbers from the paper

Learned Index

Generate Code:

```
Record lookup(key) {  
    return data[0 + 1 * key];  
}
```

Learned Index

Generate Code:

```
Record lookup(key) {  
    return data[key];  
}
```

Learned Index

Generate Code:

```
Record lookup(key) {  
    return data[key];  
}
```

Lookup Latency: **10ns** (learned index) vs **100ns*** (ARTfull)
or one-order-of-magnitude better

Space: **0MB** vs **1953MB**
Infinitely better :)

~~UNFAIR?~~

What about Updates and Inserts?

What about Updates and Inserts?

Alex Galakatos, Michael Markovitch, Carsten Binnig, Rodrigo Fonseca, Tim Kraska:

A-Tree: A Bounded Approximate Index Structure

SIGMOD 2019 (talk was yesterday)

Jialin Ding, Umar Farooq Minhas, Hantian Zhang, Yinan Li, Chi Wang, Badrish Chandramouli, Johannes

Gehrke, Donald Kossmann, David B. Lomet: **ALEX: An Updatable Adaptive Learned**

Index. CoRR abs/1905.08898 (2019)

The Simple Approach: Delta Indexing

Training a simple
Multi-Variate Regression Model
Can be done in one pass over the data

Leverage the Distribution for Appends

If the Learned Model Can Generalize to Inserts
Insert complexity is $O(1)$ not $O(\log N)$

Updates/Inserts

- Less beneficial as the data still has to be stored sorted
- Idea: Leave space in the array where more updates/inserts are expected
- Can also be done with traditional trees.
- But, the error of learned indexes should increase with

$\sqrt{N}$ per node in RMI whereas traditional indexes with N

Still at the Beginning!

- Can we provide bounds for inserts?
- When to retrain?
- How to retrain models on the fly?
- ...

A lot of follow up work (all from 2019)

Hash Map

Goal: Reduce Conflicts

Hash Map - Results

	% Conflicts Hash Map	% Conflicts Model	Reduction
Map Data	35.3%	07.9%	77.5%
Web Data	35.3%	24.7%	30.0%
Log Normal	35.4%	25.9%	26.7%

25% - 70% Reduction in Hash-Map Conflicts

An abstract architectural photograph featuring a series of thick, dark concrete beams that create a series of nested, triangular and rectangular voids. A bright light source from the left casts a strong, diagonal beam of light across the scene, highlighting the textures of the concrete and creating deep shadows. The overall composition is geometric and minimalist.

Independent of Hash-Map Architecture

Hash Map – Example Results

Type	Time (ns)	Utilization
Stanford AVX Cuckoo, 4 Byte value	31ns	99%
Stanford AVX Cuckoo, 20 Byte record - Standard Hash	43ns	99%
Commercial Cuckoo, 20Byte record - Standard Hash	90ns	95%
In-place chained Hash-map, 20Byte record, learned hash functions	35ns	100%

We Have To ~~Rewrite The~~ Bible
Start A New

Database Architecture

Database Architecture

Instance Optimality

The best performance for every user/application

Building a system from scratch for every single user is not economical

Machine Learning makes it possible and we can leverage decades of ML research

Instance Optimality

An algorithm B is instance optimal over a class of algorithm A and a database d , if for every choice of $a \in A$:

$$\text{cost}(B, d) \leq c \cdot \text{cost}(a, d) + c'$$

Learned Algorithms and Data Structures

- ML-Enhanced Algorithms, Data Structures, Systems Components Are On The Rise
- They Provide A New Way To Build Highly Customized Systems (i.e., Instance-Optimized Systems)
- Many Data-Related Problems Can Be Reduced to Learning A CDF model
- We Found That RMIs (Mixture Of Experts With Very Simple Models) Are A Very powerful Building Block
- What Makes The Approach So Powerful Is The Use Of Continuous Functions And Easy To Vectorized Math Operations (the HW has changed!!!)
