

MULTICS STAFF BULLETIN-4

To: Multics Staff
From: J. H. Saltzer
Date: December 15, 1971
Subject: MPM Table of Contents

Enclosed is the current "target" table of contents for the Multics Programmers' Manual. Update 9 converted the MPM part of the way towards this target. Since the MPM organization will be temporarily a mixture of old and new reference sections, the enclosed target may be of some help in figuring out where suggested additions might be placed.

C O N T E N T S

PREFACE	iii
FOREWARD: Plan of the Multics Programmers' Manual	v
PART I: INTRODUCTION TO MULTICS	
Chapter 1 Overview of Multics	
Highlights of the Multics system	1- 1
A Multics bibliography	1-15
Chapter 2 Introduction to the Concepts of Multics	
The Multics virtual memory	2-1
The GE-645 processor	
Use of the virtual memory	
Intersegment linking and addressing	
Program synthesis	
Access control	
Secondary storage reliability measures	
Protection rings	
Input and output	
Calendar clock	
Chapter 3 Beginner's Guide to the Use of Multics	
The mechanics of console usage	3- 1
A Multics console session	3- 5
Typing and editing information	3-11
Using the Multics storage system	3-19
Access control in Multics	3-29
Chapter 4 Programming in the Multics Environment	
Addressing on-line storage	4-1
Input and output programming	
Some sample programs	

PART II: REFERENCE GUIDE TO MULTICS

Section 1 The Multics Command Language Environment

- 1.1 The Multics command repertoire
- 1.2 Protocol for logging in
- 1.3 Typing conventions
- 1.4 The command language
- 1.5 Naming conventions
- 1.6 The Limited Service System
- 1.7 Absentee use of Multics
- 1.8 The Multics Dartmouth System

Section 2 The Multics Programming Environment

- 2.1 The Multics subroutine repertoire
- 2.2 Programming languages
- 2.3 The usual contents of an address space
- 2.4 Error handling
- 2.5 Constructing commands
- 2.6 Standards for system programming
- 2.7 The use of interprocess communication
- 2.8 Clock services

Section 3 Using the Multics Storage System

- 3.1 The storage system directory hierarchy
- 3.2 The system libraries and search rules
- 3.3 Dynamic linking and unlinking
- 3.4 The use of protection rings
- 3.5 Multi-segment files
- 3.6 The file manager

Section 4 Input and Output Facilities

- 4.1 Use of the input and output facilities
- 4.2 Use of the input and output system
- 4.3 Available input and output facilities
- 4.4 Bulk input and output
- 4.5 Graphics support on Multics
- 4.6 Writing an I/O system interface module

Section 5 Standard Data Formats and Codes

- 5.1 ASCII character set
- 5.2 Punched card codes
- 5.3 Multics standard magnetic tape format
- 5.4 Multics standard data type formats
- 5.5 Standard segment formats
- 5.6 Standard object segments
- 5.7 Standard stack formats

Section 6 Other Standards and Conventions

- 6.1 Reserved names
- 6.2 Standard subroutine calling sequence
- 6.3 Short calling sequence
- 6.4 Standard checksum
- 6.5 System conditions and default handlers
- 6.6 Control argument conventions

Section 7 Miscellaneous Reference Data

- 7.1 System error codes and meanings
- 7.2 List of error messages
- 7.3 Hardware fault assignments
- 7.4 Simulated fault assignments
- 7.5 Compatibility with future hardware
- 7.6 List of names in the system libraries
- 7.7 Obsolete Procedures

Section 8 Commands and Active Functions

Section 9 Subroutine Calls
