Subject: System Maintenance Status, June 15 - August 9

1. Significant Events

The various hardware components which were required for the support of a development system were finally moved to 575 Tech. Square, after several delays. We now have the development system available during the day, thus making system testing much easier.

After many months of save/restor testing the MTS-500 tape subsystem replaced the older controller and handlers on the service system. Thus far problems have been relatively few.

The various preparations required for the addition of the Network library have been completed and the first installations have taken place. However, recent plans call for the addition of a new "Unbundled" library, so many of the same sorts of changes are once again going to be required.

Another recent decision was to cease having microfiche copies of the online listings made. In addition to reducing the difficulty of handling listings, this should allow us to react more quickly to system problems as our copies of listings should be much more up to date. We have also decided to begin recompiling all system changes, rather than just hardcore. This will give us additional assurance that our listings correspond with the installed object code.

A. Online System Installations

During the period from June 17 - August 9 there were a total of 413 changes to the online libraries. The largest change was the movement of the gcos subsystem from the tools library to the standard service system; the most significant change was the installation of the "do" command. In addition, a new binder was installed and the first installation in the new network library was performed.

Multics Project internal working documentation. Not to be reproduced or distributed outside the Multics Project.

B. Other Installations

During this reporting period we installed hardcore systems MSS 23.12, 23.12a, 23.13, 23.13a, 23.13b, 23.14, 23.14a, 23.14b, 23.14c, and 23.15. Although we experienced some problems with the installation of the cache software (MSS 23.14) in general the installations went quite smoothly. In addition to the cache software we installed fixes for and/or new versions of system_control_, the tty dim, tape_ (for MTS-500's), formline_, user ring I/O (with EIS), the printer dcm, and the PRPH card format. In addition, BOS 1.39 was installed with a number of fixes, primarily for SAVE and RESTOR with the MTS-500's.

C. Crash Analysis

During the past 8 weeks system reliability has remained at a fairly constant level of 1 crash per day, in spite of many system installations, the removal of development system hardware, and hot weather. We seem to be gradually finding and fixing a significant number of both hardware and software problems, so the outlook for future system stability remains good.

2. Problem Areas

Two months ago we reported that the directory hash table overflow problem had become quite serious. In response to this, Peter Kelley modified the way the installation tools handle names on segments being deleted, giving us some breathing room for the moment.

The work required by the creation of the Unbundled library and the conversion to recompiling all submissions may prove to be a bit much over the next couple of months. We hope to have these modifications completed by October 1, but that date may have to slip some.

One problem which sounds like it isn't is giving us a bit of trouble. For the past few months Peter has been

attempting to get some crash analysis experience. Unfortunately, there have been relatively few system crashes, and those that have occurred have resulted in dumps which are more odd than instructive. Hopefully this problem can be solved with more straightforward dumps rather than more numerous crashes.

3. Task Status

Arlene has completed the changes required for the creation of the new "Network" library and has made the first installation in it. In addition, she has set up procedures for maintaining directories containing all online information used during a week of installations. This directory can then be sent to external sites and easily processed as submissions there. In the next few weeks she will be primarily concerned with the addition of the unbundled library and the change to installation procedures required to handle recompilations.

Grace has completed most of the work necessary for the addition of user notification to our Backup system. She has published an MTB and is now waiting for approval of her MCR. In addition, she has been working with Peter to learn about hardcore installations. In this area, both she and Peter have gotten some hands on experience with the Development System in Tech. Square as they have tested several systems there. Peter has completed a number of changes and revisions to the installation tools and continues to make minor modifications as necessary. His work on crash analysis continues to progress, but slowly due to the lack of dumps to work on.

Gary's work on the reduction compiler and the library descriptor compiler is nearly completed, as they are now just being updated to current standards. He is still hopeful of a completion date of September 30 for the current set of tasks and documentation.

4. Work Planned for the Coming Month

During the next few weeks we expect to begin work on the unbundled library and recompilations. In addition, I'm hoping that one or more people in the group will get a chance to work on the new page control being proposed by Steve Webber. I'm not certain at this point when work will begin on this, but I think it could be valuable experience. Also, we expect that Grace's changes to Backup to allow user notification of errors encountered will be approved and installed.
