SUBJECT: ANSI Standard Tape I/O Module - Project Status

## I. SIGNIFICANT EVENTS

Testing of Version Three of the ANSI Tape I/O Module is complete, including multi-volume file/file-set capability. Work on support of IBM Standard Labeled tapes has begun, and is proceeding on schedule. A meeting with Multics COBOL compiler development group has been scheduled for December 3 to discuss COBOL tape requirements.

## II. TASK STATUS

The code supporting the iox\_position and iox\_read\_length entry points has been written and tested. The multi-volume capability was written and tested, using both single and multiple drives. Code to provide a run-time volume initialization capability was added to the I/O Module.

A new MTB is being prepared which describes the latest (and final) changes to the attach description, the new position and read\_length entries, and a detailed description of the control operations. An MCR will be submitted as soon as the MTB has been published.

## III. PROBLEM AREAS

The ANSI standard requires that volumes be initialized with a VOL1 label and a dummy file before they can be used for output. The rules which determine whether or not a volume can be initialized (or, in certain cases, re-initialized) are rather complex; furthermore, the standard prohibits the application program from overriding these rules.

The ANSI I/O Module makes provision for querying the user when override permission is needed, although this action is not strictly in accordance with the standard. It therefore appears as though a new command which can initialize volumes before they are used should be written.

Multics Project internal working documentation. Not to be reproduced or distributed outside the Multics Project.

#### IV. FUTURE PLANS

During December, the ANSI I/O Module will be extended to support user file labels and the COBOL OPEN and CLOSE requirements. The processing of IBM standard label and non-labeled tape (excluding DOS LTM format) will be implemented.

An MTB describing the final ANSI I/O Module interfaces will be published, and an MCR submitted. As the IBM I/O Module operation and interface does not differ significantly from the ANSI I/O Module, a separate MTB will not be written. The ANSI MCR will cover the IBM module, which is really only a different entry in the ANSI attach code.

The PLM documentation will be written during the first two weeks of January; there is no need for its completion before installation.

Note that the above schedule is contingent upon reasonable "meshing" of the I/O Module implementation with the requirements of the COBOL compiler development group. After reading over a Honeywell document, Functionality for Tape Handling in ANS COBOL, it appears as though there will be no serious difficulty in modifying and extending the I/O module to conform to their needs. Of course, the final determination cannot be made until the meeting with the group actually takes place.
