THE CASE FOR CAPABILITY-BASED COMPUTERS, by R. S. Fabry  
from J. H. Saltzer

The first draft of a paper with the above title, by Bob Fabry of the University of California at Berkeley, recently arrived. It provides some perceptive insights into the problem of addressing data, although it seems to be primarily an argument for use of unique identifiers for segment numbers. The paper is in my files for anyone who would like to make a copy.
