Date: 4/5/72

All PTW problems remain unsolved, although a system which is hoped to have all sources tagged was slated to go in today.

It was agreed that experiments should be performed to determine whether or not the current scheme of post-purging shared segments is desirable.

Newly-designated critical problems are: 1) a bug in the BOS tape reading package, 2) an apparent bug in the Salvager (although rumor has it that Tuesday's problems actually stemmed from a configuration mixup, 3) the 2-fold drum DIM does not work with PML, and 4) illegal procedure faults in ring 0 can cause crashes; our old friend X0 seems to be involved; Webber has a theory re software cause, will look at dump in a attempt to confirm it.

Other discussion at the meetings concerned lower-priority tasks and is not germane to these minutes.
