## HARDWARE - S. D. Sprague

### DSU190

- . Power faults on unit #7. FED noted a DC voltage loss and will follow up.
- . Leo noted that units 10, 12 are getting device in standby conditions regularly. Although this does not crash the system, it may be an indication of future problems.

### Mem

- . SCU-A Store B had parity. FED ran T&Ds but couldn't find a failure.

### CACHE

- . Load parity errors. FED points out that this is not necessarily a cache hardware problem because it seems to be happening during the load.

## SOFTWARE - P. B. Kelley

- . System 31.3c running
- . Mylock problem crashing system

### OTHER

- . MSU0451 installed and checked out.  
Units to be turned over for use on July 1, 1977.
