MASSACHVSETTS INSTITUTE OF TECHNOLOGY

Department of Electrical Engineering and Computer Science 6.001—Structure and Interpretation of Computer Programs Spring Semester, 1999

Recitation – Friday, February 12

1. Cons Pairs and Lists

Recall the contract for cons, car, cdr, pair?, and null?.

```
(car (cons a b)) == a
(cdr (cons a b)) == b
(pair? (cons a b)) == #t
(cons c nil)))
```

There are three main methods of representing cons and list structures. You should be able to convert between them.

Scheme Expression	Box & Pointer	Scheme Printout
$(\cos 1 2)$		
(cons 1 (cons 2 nil))		
(cons 1 nil)		
$(\cos 1 (\cos 2 3))$		
(cons (cons 1 2) nil)		
(list 1 2 3 4)		
(list 1 (cons 2 3) (list 4 5))		

2. Other Accessors

In scheme, we often want to access elements deep in a cons structure. Therefore, the following accessors have been defined to help us out:

For lists, we also often want to easily access the n'th element of a list. The accessors first, second, third, ..., tenth are defined to access the corresponding values of a list. For example,

```
(sixth (list 1 2 3 4 5 6 7 8 9)); Value: 6
```

How could you define first, second, third, and fourth using the c???r functions?

```
\begin{array}{ll} (\text{first x}) & = & (\text{third x}) = \\ (\text{second x}) & = & (\text{fourth x}) = \end{array}
```

3. Practice

Draw box and pointer diagrams and write what will Scheme print for the following expressions.

```
⇒ (define x (cons 5 2))
⇒ (car x)

⇒ (cdr x)

⇒ (car (cdr x))

⇒ (define y (cons sqrt x))
⇒ (car (cdr y))

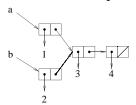

⇒ (car y)

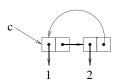

⇒ (define z (cons ((car y) 49) x))
⇒ z
```

Write a Scheme expression that will print each of the following. Also draw box and pointer diagrams.

```
⇒
; Value: (1 2 3)
⇒
; Value: (1 2 . 3)
⇒
; Value: (1 2 . 3)
; Value: ((1 (2)) . 3)
```

Write Scheme expressions that correspond to the following.

4. Functions on Lists

pair? is $\Theta()$ and list? is $\Theta()$

We saw that we have the primitive function pair? to see if an object is a pair. What if we wanted to write the function list? to see if an object is a list?

```
What is the contract for list? \forall x_1, x_2, \dots, x_n (list? (list x_1 \ x_2 \dots x_n)) == #t What's another way to write it? (list? nil) = #t (list? (cons x \ l)) == #t \Rightarrow (list? l) Now, how can we write list? in scheme? (define (list? x)

What is the Order of Growth of pair? and list? ?
```
